Test place	Ise EMC Lab. No.8 Measurement Room	
Date	February 13, 2024	February 14, 2024
Temperature / Humidity	25 deg. C / 39 % RH	24 deg. C / 42 % RH
Engineer	Yuta Moriya	Yuta Moriya
Mode	Communication 11ax-20 / 11ax-160	

Incumbent signal plots

[20MHz BW mode]
All tests were conducted with the Incumbent Signal frequency set to the middle of EUT channel and a nominal 99% Occupied Power Bandwidth of 10 MHz.

[160MHz BW mode]
All tests were conducted with the Incumbent Signal frequency set to as closely as possible to the lower edge of the EUT channel, in the middle of EUT channel, and as closely as possible to the upper edge of the EUT channel and a nominal 99% Occupied Power Bandwidth of 10 MHz.

Reference Plot
U-NII-5

Reference Plot
U-NII-6

*Incumbent signal power takes into account customer-supplied cable losses.

Contention Based Protocol

EUT response to the applied incumbent signal

A link between the EUT and the Companion Device was established on the test channel. Traffic flowing from the EUT to the Companion Device was then initiated. A sweep was started, and the incumbent signal was continuously applied at approximately 5 seconds after the start of the sweep for a duration of 30 seconds and removed after the end of the observation period. Marker 1R is placed at the beginning of the observation period and Marker 1 is placed at the end of the observation period.

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

Span was set to zero to ensure detection of transmissions from the EUT.

Reference Plot

Ceased: The level at which no transmission is detected, consistently for a minimum period of 10 seconds.

Minimal: The AWGN level at which the system begins to trigger the transmission switch off, albeit not being kept off consistently.

Normal: The level at which there is no apparent detection and the operation of the EUT is still considered optimal.

Contention Based Protocol

Reference Plot

Ceased: The level at which no transmission is detected, consistently for a minimum period of 10 seconds.
Minimal: The AWGN level at which the system begins to trigger the transmission switch off, albeit not being kept off consistently.
Normal: The level at which there is no apparent detection and the operation of the EUT is still considered optimal.

Contention Based Protocol

CBP Bandwidth Reduction Description

It was confirmed how the channel is reduced when AWGN is injected at the lower edge of the EUT channel, in the middle of EUT channel, and as closely as possible to the upper edge of the EUT channel.

*No EUT transmission was confirmed after the incumbent signal was injected.

→ : Incumbent Signal

Contention Based Protocol

*No EUT transmission was confirmed after the incumbent signal was injected.

→ : Incumbent Signal

Contention Based Protocol

Adjusted Incumbent Power = Incumbent Power - Cable Loss - Antenna gain

*The antenna gain value was applied as conservative condition.

The testing was performed with the AWGN signal set to Normal level (more than 20 dB below the -62 dBm threshold) and increased until the EUT detected and stopped transmitting (Ceased level).

EUT Tx Status means below

Ceased: The level at which no transmission is detected, consistently for a minimum period of 10 seconds.

Minimal: The AWGN level at which the system begins to trigger the transmission switch off, albeit not being kept off consistently.

Normal: The level at which there is no apparent detection and the operation of the EUT is still considered optimal.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.
