REPORT NO. B80418D1
DATE: APRIL 24, 1998

SUMMARY OF TEST REPORT

This electromagnetic emission test report is generated by Compatible Electronics Inc., which is an independent consulting firm. The test report is based on the emission data measured by Compatible Electronics personnel according to the ANSI C63.4 1992 measurement procedure. The site attenuation measurement data for the firm's open field test site is filed with FCC, according to the ANSI C63.4 1992. The test results, provided with this report, indicate that the electromagnetic emissions from the equipment tested are within the specification limits defined by FCC Title 47, Part 15, Subpart C. Section 15.247.

Device Tested: 900 MHz Spread Spectrum Cordless Phone
Model: EXS9110

Manufacturer: Uniden America Corporation
Engineering Service Office, 216 John Street,
PO Box 580 Lake City, South Carolina, 29560

Frequency Ranges of the Test: Conducted: 450 kHz to 30 MHz
Radiated: 10 kHz to 9.28 GHz

Test Location: 114 Olinda Drive, Brea, California 92823

Test Dates: April 13, 14, 15, and 17, 1998

The measurement data and conclusions are a true and accurate representation of the electromagnetic emissions characteristics of the test sample described in this report.

Report prepared by:

Kyle Fujimoto
Test Engineer
Compatible Electronics, Inc.

Approved by:

Scott McCutchan
Lab Manager
Compatible Electronics, Inc.

1. PURPOSE

This test report describes the electromagnetic emissions tests performed and the results obtained on the equipment described herein, based on the emission data measured by Compatible Electronics personnel. The measurements were performed according to the ANSI C63.4 1992 measurement procedure to determine whether the electromagnetic emissions from the equipment tested are within the specification limits defined by FCC Title 47, Part 15, Subpart C., Section 15.247.

2. DESCRIPTION OF TEST SAMPLE

The components of the EUT were tested separately.

Specifics of the EUT and Peripherals Tested

Handset being tested: The 900 MHz Spread Spectrum Cordless Phone-Handset Model: EXS9110 (EUT) was placed on the wooden table and tested in three orthogonal axis. The low (channel 1), medium (channel 10), and high (channel 20) channels were tested. The handset was transmitting to and receiving from the 900 MHz Spread Spectrum Cordless Phone base. The EUT was investigated for emissions while off hook. The radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in Appendix B.

Base being tested: The 900 MHz Spread Spectrum Cordless Phone - Base Model: EXS9110 (EUT) was placed on the wooden table. The low (channel 1), medium (channel 10), and high (channel 20) channels were tested. The base was connected to a line simulator and AC adapter via its RJ-11 and power ports, respectively. The line simulator was connected to the Comdial telephone. The base was transmitting and receiving from the 900 MHz Spread Spectrum Cordless Phone handset. The 900 MHz Spread Spectrum Cordless Phone handset was also used to dial out a number on the simulator that caused the Comdial telephone to ring. The conducted as well as radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in Appendix B.

3. PROCESSING GAIN

The Processing Gain was measured using the CW jamming margin method. Figure 1a shows the test configuration. The test consists of stepping a signal generator in 50 kHz increments across the passband of the system (up to 750 kHz away from the center frequency). The passband of the system is 1.4 MHz (± 700 kHz). At each point, the generator level required to produce the recommended Bit Error Rate (BER) (Set at BER=10 to the negative third power) is recorded. This level is the jamming level. The output power of the transmitter unit is measured at the same point. The Jammer to Signal (J/S) ratio is then calculated. Discard the worst 20% of the J/S data point. The lowest remaining J/S ratio is used to calculate the processing gain. The maximum implementation loss a system can claim in calculating processing gain is 2 dB. The equation to calculate the processing gain (Gp) is the following:

$$G_p = (S/N)_o + M_j + L_{sys}$$

Where L_{sys} = system implementation loss = 2dB

M_j = jamming margin (J/S) in dB,

$(S/N)_o$ = signal to noise ratio required for a DBPSK system with BER of 10 to the negative third power.

The theoretical GP is 11 dB

4. TRANSMITTER

The transmitter takes baseband data, high pass filters it to remove any DC contributed by bias networks, then lowpass filters it to provide spectral shaping. After filtering, the resultant signal is modulated to the synthesized RF carrier. The modulated signal is then amplified to one of the three transmit power levels. The harmonics of the amplified signal are removed with a 1.2 GHz lowpass filter. Finally, the signal is routed through the T/R switch for transmission by the antenna.

5. TRANSMITTER POWER

Transmit power is herein defined as the power delivered to a 50 Ohm load at the antenna port of the T/R switch.

Power Level	Power	Accuracy
high	18 dBm	+2/-2 dB
medium	9 dBm	+3/-3 dB
low	-1 dBm	+3/-3 dB

6. CHANNEL NUMBER AND FREQUENCIES

The RF channels occupy the frequency band 904.2-925.8 MHz and are numbered 1 to 20.

Channel Number	Channel center Frequency (MHz)
1	904.2
2	904.8
3	906.0
4	907.2
5	908.4
6	909.6
7	910.8
8	912.0
9	913.2
10	914.4
11	915.6
12	916.8
13	918.0
14	919.2
15	920.4
16	921.6
17	922.8
18	924.0
19	925.2
20	925.8

7. CHIPPING RATE

A 12-chip spreading code is used. The spreading code cyclic duration is 12 times that of the encoded data. The code starts and stops on encoded bit boundaries.

8. SPREADING GAIN

The spreading gain is 11 dB.

9. ANTENNA GAIN

The antenna gain is +3.34 dBi for the base, and +1.74 dBi for the handset.

10. TEST EQUIPMENT

The test equipment used during the test described in this report are listed in Table 1.

Test Equipment Modes and Settings

Conducted Test

The HP 8566B spectrum analyzer was used as a measuring meter along with the HP 85650A quasi-peak adapter. The data was collected by the spectrum analyzer in peak detect mode with the "Max Hold" feature activated. The quasi-peak detection was used only where indicated in the data sheets. A 10 dB attenuation pad was used for the spectrum analyzer input stage protection and the program settings were adjusted accordingly to indicate the actual reading in the program output. One LISN output was read by the HP 8566B spectrum analyzer at a time while the output of the second LISN was terminated by a 50 ohm termination. The effective measurement bandwidth used for the conducted emissions test was 9 kHz.

Radiated Test

The HP 8566B spectrum analyzer was used as a measuring meter along with the HP 85650A quasi-peak adapter.

The spectrum analyzer was used in the peak detect mode with the "Max Hold" feature activated. In this mode, the spectrum analyzer records the highest measured reading over all the sweeps. The quasi-peak detection was used only for those readings which are marked accordingly in the data sheet. The effective measurement bandwidth used for the radiated emissions test was 200 Hz from 10 kHz to 150 kHz, 9 kHz from 150 kHz to 30 MHz, 120 kHz from 30 MHz to 1 GHz, and 1 MHz from 1 GHz to 9.28 GHz.

Broadband loop, biconical, log periodic, and horn antennas were used as transducers during the measurement. The frequency spans were wide (10 - 150 kHz, 150 - 540 kHz, 540 kHz - 1.6 MHz, 1.6 - 5 MHz, 5 - 10 MHz, 10 - 30 MHz, 30 - 88 MHz, 88 - 216 MHz, 216 - 300 MHz, 300 MHz - 1 GHz, and 1 GHz - 9.8 GHz) during preliminary investigations. However, the final data was taken with a frequency span of 1 MHz. Furthermore, the frequency span was reduced during the preliminary investigations as deemed necessary.

11. TEST PROCEDURE

Conducted Test

Test Setup

The EUT was set up as a table top equipment as shown in Figure 1. The test data was collected using the Hewlett Packard spectrum analyzer Model: 8566B and the Hewlett-Packard quasi-peak adapter Model: 85650A.

The conducted test for the table top EUT was performed on a 1.0 by 1.5 meter wooden test table. (see Figure 1). The test bench has its top surface 0.8 meter above the ground plane. The EUT is powered through the Line Impedance Stabilization Network (LISN) bonded to the ground plane. The LISN power was filtered and the filter was bonded to the ground plane. The EUT was set up on the rear of the wooden test bench 40 cm away from the vertical conductive surface and at least 80 cm away from the LISNs as specified in ANSI C63.4 1992. The excess power cord was wrapped in a figure 8 pattern to form a bundle approximately 8 cms in length.

Preliminary Conducted Test

The initial test data was taken in manual mode to investigate the worst emission configuration. While scanning the frequencies in the ranges of 0.45 MHz to 1.6 MHz, 1.6 MHz to 5 MHz and 5 MHz to 30 MHz, the conducted emissions from the EUT were investigated for maximizing operating mode as well as cable placement. Once a predominant frequency (within 12 dB of the limit) was found, it was more closely examined with the spectrum analyzer span adjusted to 1 MHz.

Final Conducted Data

The EUT configuration was set for the highest emission frequency and data was collected under program control by the HP 9153B controller for the conducted test. The data was collected by the HP controller in several overlapping sweeps by running the spectrum analyzer at a minimum scan rate of 10 seconds per octave.

The spectrum analyzer collected the maximum peak readings over each spectrum. The six highest emission levels and corresponding frequencies were sorted by the computer and are listed in Table 2.0.

Radiated Test

The open field test site of Compatible Electronics, Inc. was used for radiated emissions testing. This test site is set up according to the ANSI C63.4 1992 and the site attenuation data has been filed with the FCC. Figure 2 shows the layout of the open field test site. The turntable is remote controlled using a motor. The turn table supporting the EUT permits EUT rotation over 360 degrees to determine the highest emission levels. The antenna mast allows height variation of the antenna from 1 meter to 4 meters.

Preliminary Testing and Monitoring

Preliminary testing was done at a distance of 3 meters to determine the predominant frequencies from the system and to investigate the EUT configuration that produced the maximum levels of emissions. An open field test site was used for the preliminary investigations. Broad band antennas were used to scan large frequency bands while manipulating cables. All significant frequencies were further examined carefully at a reduced frequency span on the spectrum analyzer, while optimizing the cables, and changing the antenna height and EUT orientation. The EUT was tested at a 3 meter test distance to obtain final test data as described below.

Final Radiated Test

The receiving antenna was mounted on the antenna positioning mast, which is motor controlled and allows antenna height variation from 1 meter to 4 meters above the ground plane. The antenna height was varied to find the highest level of radiated emission at each frequency found during the preliminary test described above. The six highest emission readings and the corresponding frequencies for non-harmonic spurious emissions (excluding the fundamental) are listed in Table 3.0 for the base and Table 4.0 for the handset. The six highest emission readings and the corresponding frequencies for the fundamental and harmonics are listed in Table 5.0 for the base, Table 6.0 for the handset.

Processing Gain - base station output to handset input

The base was connected by its test connector (an internal serial port) to the communications analyzer (computer) via com port 1. 43.3 dB of attenuation was placed on the output of the base. The output of the base was combined with the output of the signal generator through a combiner. The handset was connected by its test connector (an internal serial port) to the communications analyzer (computer) via com port 2. The signal generator was stepped in 50 kHz increments across the passband ($\pm$ of the fundamental transmit frequency). The Bit Error Rate used was 0.1%. When this error rate was achieved (displayed on the computer), the reading of the signal generator was taken. This reading was then subtracted from the signal level of the base station (while adding in the combiner loss and signal generator calibration factor) to obtain the J/S ratio. The J/S ratio was then combined with the system loss (2 dB) and signal to noise ratio (8 dB) of the unit to obtain the processing gain.

Processing Gain - handset output to base station input

The handset was connected by its test connector (an internal serial port) to the communications analyzer (computer) via com port 1. 43.3 dB of attenuation was placed on the output of the handset. The output of the handset was combined with the output of the signal generator through a combiner. The base was connected by its test connector (an internal serial port) to the communications analyzer (computer) via com port 2. The signal generator was stepped in 50 kHz increments across the passband of the fundamental transmit frequency. The Bit Error Rate used was 0.1%. When this error rate was achieved (displayed on the computer), the reading of the signal generator was taken. This reading was then subtracted from the signal level of the base station (while adding in the combiner loss and signal generator calibration factor) to obtain the J/S ratio. The J/S ratio was then combined with the system loss (2 dB) and signal to noise ratio (8 dB) of the unit to obtain the processing gain.

Transceiver Requirements Per Section 15.247 (FCC- Subpart C).

Both the handset and the base have a bandwidth of at least 500 kHz. The bandwidth is measured at the -6dB points. (Please see data sheets located in Appendix A). [section 15.247 (a)(2)]

Both the handset and the base have a peak output power of less than 1 Watt (30 dBm) [section 15.247 (b)]

No radio frequency power that is produced by the modulation products of the spreading sequence, the information sequence and the carrier frequency is within 20 dB of the limit or exceeds the general radiated emission limits specified in section 15.209(a) while using a 100 kHz bandwidth. (Please see the data sheets located in Appendix A.) [section 15.247 (c)].

The spectral density output averaged over any 1 second interval using a resolution bandwidth of 3 kHz is not greater than 8dBm for both the handset and the base. (Please see data sheets located in Appendix A.) [section 15.247 (d)].

The processing gain of a direct sequence system is at least 10 dB. (Please see data sheets located in Appendix A) [section 15.247 (e)]

13.

SAMPLE CALCULATIONS

The use of the Com-Power Preamplifier Model: PA-102, the Hewlett-Packard Microwave Amplifier Model: 8349B, and the Com-Power Microwave Amplifier Model: PA-122 during the radiated emissions test requires that the effective gain must be subtracted from the spectrum analyzer (meter) reading. In addition, a correction factor for the antenna, amplifier, cable loss, and a distance factor, if any, must be applied to the meter reading before a true field strength reading can be obtained.

The equation can be derived in the following manner:

$$\frac{\text{Corrected}}{\text{meter reading}} = \text{meter reading} + F - G$$

where, F = antenna factor
 G = effective gain =
(amplifier gain-cable loss)

The correction factors for the antenna and the effective gain are attached in Appendix C of this report. The data sheets are attached in Appendix A.

There is no correction factor for the distance because the final data is always taken at 3 meters which is the FCC specification test distance.

14.

CONCLUSION

The 900 MHz Spread Spectrum Cordless Phone Model: EXS9110 meets all of the specification limits defined in FCC Title 47, Part 15, Subpart C Section 15.247.

DESCRIPTION OF EUT CONFIGURATION AND CABLE INFORMATION 900 MHz Spread Spectrum Cordless Phone MODEL: EXS9110

EUT CONFIGURATION

Handset being tested: The 900 MHz Spread Spectrum Cordless Phone- Handset Model: EXS9110 (EUT) was placed on the wooden table and tested in three orthogonal axis. The low (channel 1), medium (channel 10), and high (channel 20) channels were tested. The handset was transmitting to and receiving from the 900 Spread Spectrum Telephone base. The EUT was investigated for emissions while off hook. The radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in this Appendix.

Base being tested: The 900 MHz Spread Spectrum Cordless Phone - Base Model: EXS9110 (EUT) was placed on the wooden table. The low (channel 1), medium (channel 10), and high (channel 20) channels were tested. The base was connected to a line simulator and AC adapter via its RJ-11 and power ports, respectively. The line simulator was connected to the Comdial telephone. The base was transmitting and receiving from the 900 MHz Spread Spectrum Cordless Phone handset. The 900 MHz Spread Spectrum Cordless Phone handset was also used to dial out a number on the simulator that caused the Comdial telephone to ring. The conducted as well as radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in this Appendix.

CABLE CONSTRUCTION AND TERMINATION

HANDSET BEING TESTED

Cable 1

This is a 6 foot unshielded cable connecting the headphones to the handset. It has a 1/8 inch stereo connector at the headphones end and is hard wired into the handset.

BASE BEING TESTED

Cable 1

This is a 6 foot unshielded cable connecting the base to the line simulator. It has an RJ-11 connector at the line simulator end and is hard wired into the base. The cable was bundled to a length of 1 meter.

Cable 2

This is a 6 foot unshielded cable connecting the telephone to the line simulator. It has an RJ-11 connector at the line simulator end and is hard wired into the telephone. The cable was bundled to a length of 1 meter.

Cable 3

This is a 6 foot unshielded round cable connecting the base to the AC adapter. It has a 1/8" power jack at the base end and is hard wired into the AC adapter.

APPENDIX D

MODIFICATIONS TO THE EUT

MODIFICATIONS TO THE EUT

The modifications listed below were made to the EUT to pass FCC Subpart C Section 15.247 (c) specifications.

All the rework described below was implemented during the test in a method that could be reproduced in all the units by the manufacturer.

Modifications:

- 1) Change R227 on the base from 1800 ohms to 2200 ohms.
- 2) Change R627 on the handset from 1800 ohms to 2200 ohms
- 3) Affix copper adhesive tape to the side of the RF module for both the base and handset. The size of the copper adhesive will be 10 mm X 20 mm. (See diagram on next page)

RF MODULE

GIND-X04

TOP VIEW (X) = SCREW

Base : RF UNIT

HANDSET : RF UNIT

Copper Tape.

(SIZE: 10 mm X 20 mm)

**COMPATIBLE
ELECTRONICS**

FCC ID'S: AMWUC604, AJXSX2108, AAO4301102

APPENDIX E

***ADDITIONAL MODELS COVERED
UNDER THIS REPORT***

ADDITIONAL MODELS COVERED UNDER THIS REPORT

USED FOR THE PRIMARY TEST

900 MHz Spread Spectrum Cordless Phone
Brand: Uniden
Model: EXS9110
S/N: Prototype
FCC-ID: AMWUC604

Note: The chassis for the Uniden model is 100% plastic.

ALSO APPROVED UNDER THIS REPORT:

1. Brand: Toshiba
Model: SX-2108
FCC-ID: AJXSX2108
2. Brand: Radio Shack
Model: 43-1104
FCC-ID: AAO4301102

Both the Toshiba and Radio Shack Models are exactly the same electrically and will have 100% plastic chassis for both the base and handset.
