Aviation Altimeter

Report # HNYE0001 Rev. 1

NVLAP LAB CODE: 200881-0

This report must not be used to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government. This Report shall not be reproduced, except in full without written approval of the laboratory.

CERTIFICATE OF TEST

Last Date of Test: July 12, 2019

Honeywell

Model: SARA

Radio Equipment Testing

Standards

Specification	Method
FCC 87.131:2019	ANSI TIA-603-E:2016
FCC 87.133:2019	
FCC 87.139:2019	
FCC 87.139(a):2019	
FCC 87.139(d):2019	

Results

Method Clause	Test Description	Applied	Results	Comments
N/A	Modulation Requirements	No	N/A	Not required to test. Assumes manufacturer will provide all required test data.
N/A	Powerline Conducted Emissions	No	N/A	Not required, assuming device is DC powered and will not be connected to the public AC mains during normal operation.
5.2.4.2	Output Power	Yes	Pass	
5.4	Occupied Bandwidth	Yes	Pass	
5.5	Emissions Mask	Yes	Pass	
5.5	Spurious Emissions at Antenna	Yes	Pass	
5.5	Field Strength of Spurious Emissions	Yes	Pass	
5.6	Frequency Stability	Yes	Pass	

Deviations From Test Standards

None

Approved By:

Matt Nuernberg, Operations Manager

Product compliance is the responsibility of the client; therefore, the tests and equipment modes of operation represented in this report were agreed upon by the client, prior to testing. The results of this test pertain only to the sample(s) tested. The specific description is noted in each of the individual sections of the test report supporting this certificate of test. This report reflects only those tests from the referenced standards shown in the certificate of test. It does not include inspection or verification of labels, identification, marking or user information. As indicated in the Statement of Work sent with the quotation, Element's standard process is to always use the latest published version of the test methods even when earlier versions are cited in the test specification. Issuance of a purchase order was de facto acceptance of this approach. Otherwise, the client would have advised Element in writing of the specific version of the test methods they wanted applied to the subject testing.

ACCREDITATIONS AND AUTHORIZATIONS

United States

FCC - Designated by the FCC as a Telecommunications Certification Body (TCB). Certification chambers, Open Area Test Sites, and conducted measurement facilities are listed with the FCC.

A2LA - Accredited by A2LA to ISO / IEC 17065 as a product certifier. This allows Element to certify transmitters to FCC and IC specifications.

NVLAP - Each laboratory is accredited by NVLAP to ISO 17025

Canada

ISED - Recognized by Innovation, Science and Economic Development Canada as a Certification Body (CB) and as a CAB for the acceptance of test data.

European Union

European Commission – Within Element, we have a EU Notified Body validated for the EMCD and RED Directives.

Australia/New Zealand

ACMA - Recognized by ACMA as a CAB for the acceptance of test data.

Korea

MSIT / RRA - Recognized by KCC's RRA as a CAB for the acceptance of test data.

Japan

VCCI - Associate Member of the VCCI. Conducted and radiated measurement facilities are registered.

Taiwan

BSMI – Recognized by BSMI as a CAB for the acceptance of test data.

NCC - Recognized by NCC as a CAB for the acceptance of test data.

Singapore

IDA – Recognized by IDA as a CAB for the acceptance of test data.

Israel

MOC – Recognized by MOC as a CAB for the acceptance of test data.

Hong Kong

OFCA – Recognized by OFCA as a CAB for the acceptance of test data.

Vietnam

MIC – Recognized by MIC as a CAB for the acceptance of test data.

MEASUREMENT UNCERTAINTY

Measurement Uncertainty

When a measurement is made, the result will be different from the true or theoretically correct value. The difference is the result of tolerances in the measurement system that cannot be completely eliminated. To the extent that technology allows us, it has been our aim to minimize this error. Measurement uncertainty is a statistical expression of measurement error qualified by a probability distribution.

A measurement uncertainty estimation has been performed for each test per our internal quality document QM205.4.6. The estimation is used to compare the measured result with its "true" or theoretically correct value. The expanded measurement uncertainty (K=2) can be found included as part of the applicable test description page. Our measurement data meets or exceeds the measurement uncertainty requirements of the applicable specification; therefore, the test data can be compared directly to the specification limit to determine compliance. The calculations for estimating measurement uncertainty are based upon ETSI TR 100 028 (or CISPR 16-4-2 as applicable), and are available upon request.

The following table represents the Measurement Uncertainty (MU) budgets for each of the tests that may be contained in this report.

Test	+ MU	- MU
Frequency Accuracy (Hz)	0.0007%	-0.0007%
Amplitude Accuracy (dB)	1.2 dB	-1.2 dB
Conducted Power (dB)	0.3 dB	-0.3 dB
Radiated Power via Substitution (dB)	0.7 dB	-0.7 dB
Temperature (degrees C)	0.7°C	-0.7°C
Humidity (% RH)	2.5% RH	-2.5% RH
Voltage (AC)	1.0%	-1.0%
Voltage (DC)	0.7%	-0.7%
Field Strength (dB)	5.2 dB	-5.2 dB
AC Powerline Conducted Emissions (dB)	2.4 dB	-2.4 dB

PRODUCT DESCRIPTION

Client and Equipment Under Test (EUT) Information

Company Name:	Honeywell
Address:	2600 Ridgway Parkway
City, State, Zip:	Minneapolis, MN 55413
Test Requested By:	Jim Law
Model:	SARA
First Date of Test:	April 1, 2019
Last Date of Test:	July 12, 2019
Receipt Date of Samples:	April 1, 2019
Equipment Design Stage:	Production
Equipment Condition:	No Damage
Purchase Authorization:	Verified

Information Provided by the Party Requesting the Test

Functional Description of the EUT:

The SARA is a radio altimeter for commercial aviation. The device has an integral antenna and operates at 4.2 - 4.4 GHz using FMCW modulation.

Testing Objective:

To demonstrate compliance of the radio to FCC Part 87 requirements for operation in the 4200-4400 MHz band.

MODIFICATIONS

Equipment Modifications

Item	Date	Test	Modification	Note	Disposition of EUT
1	2019-04-01	Emissions Mask	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
2	2019-07-11	Frequency Stability	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
3	2019-07-12	Output Power	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
4	2019-07-12	Occupied Bandwidth	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
5	2019-07-12	Spurious Emissions at Antenna	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
6	2019-07-12	Field Strength of Spurious Emissions	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	Scheduled testing was completed.

OUTPUT POWER

XMIT 2019.06.11

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The transmit frequency was set to the required channels in each band. The transmit power was set to its default maximum.

The output power was measured for the FMCW radio based on guidance from the FCC. This allowed for FMCW measurement guidelines from KDB 890966 D01 section F to be applied. The peak power was measured across the entire span of the FMCW transmitter using settings from KDB 890966 D01 section F. The sweep speed on the spectrum analyzer was slowed enough to make sure no decrease in sensitivity or resolution would apply from when an IF amplifier is sweeping an CW signal. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_{eff} is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

The Average Factor from KDB 890966 D01 section F was then found using the following formula:

$$Average Factor = \frac{T_s}{Cycle Time} * \frac{1}{\Delta F}$$

Where T_s is the sweep time in S and ΔF is the signal sweep frequency span in MHz. The cycle time is the total time it takes for the EUT to do a complete cycle including time the EUT is not transmitting. The ratio of T_s to the Cycle Time was declared by the manufacturer to be 0.7. The value for ΔF was measured in the Occupied Bandwidth module to be 172.50 MHz. The average factor is 0.00406.

The Average Value was then calculated based off of the Peak Value multiplied by the Average Factor.

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The EUT was set to the channels and modes listed in the datasheet.

The 99% occupied bandwidth (OBW) was measured using using an Resolution Bandwidth (RBW) between 1% and 5% of the 99% OBW. The Video Bandwidth was set to 3x the RBW. A peak detector with a max hold was used.

The sweep speed on the spectrum analyzer was slowed enough to make sure no decrease in sensitivity or resolution while the IF amplifier is sweeping the CW signal. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_eff is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

The lower edge of the 99% OBW was compared against the lower edge of the authorized band to determine compliance. The upper edge of the 99% OBW was compared against the upper edge of the authorized band to determine compliance. The 99% occupied bandwidth value was calculated and is shown for informational purposes only.

TEST DESCRIPTION

The highest gain antenna of each type to be used with the EUT was tested. The EUT was configured for transmitting in FMCW mode.

For each configuration, the spectrum was scanned throughout the specified range as part of the exploratory investigation of the emissions. These “pre-scans” are not included in the report. Final measurements on individual emissions were then made and included in this test report.

The individual emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis if required, and adjusting the measurement antenna height and polarization (per TIA-603-E:2016). A preamp and high pass filter were used for this test in order to provide sufficient measurement sensitivity.

Measurements were made with the required detectors and annotated on the data for each individual point using the following annotation:

QP = Quasi-Peak Detector

PK = Peak Detector

AV = RMS Detector

Measurements were made to satisfy the specific requirements of the test specification for the emissions mask. Measurements of the fundamental were made across a sufficient span to see the entire intended signal. Measurements were made with a slow enough sweep speed to satisfy the bandwidth concerns of the FCC. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_eff is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

If there are no detectable emissions above the noise floor, the data included may show noise floor measurements for reference only.

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The spurious RF conducted emissions were measured with the EUT set to transmit FMCW centered at 4300 MHz. The spectrum was scanned throughout the specified frequency range using a peak detector. The sweep speed on the spectrum analyzer was slowed enough to make sure no decrease in sensitivity or resolution would apply from when an IF amplifier is sweeping an CW signal. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_eff is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

The peak value was recorded and compared to the limit to determine compliance.

FIELD STRENGTH OF SPURIOUS EMISSIONS

PSA-ESCI 2019.02.26

TEST DESCRIPTION

The highest gain antenna of each type to be used with the EUT was tested. The EUT was configured for transmitting in FMCW mode.

For each configuration, the spectrum was scanned throughout the specified range as part of the exploratory investigation of the emissions. These "pre-scans" are not included in the report. Final measurements on individual emissions were then made and included in this test report.

The individual emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis if required, and adjusting the measurement antenna height and polarization (per TIA-603-E:2016). A preamp and high pass filter were used for this test in order to provide sufficient measurement sensitivity.

Measurements were made with the required detectors and annotated on the data for each individual point using the following annotation:

QP = Quasi-Peak Detector

PK = Peak Detector

AV = RMS Detector

Measurements were made to satisfy the specific requirements of the test specification for out of band emissions. Measurements were made across a sufficient span to see the entire spurious emission made from the harmonics of the FMCW range. Measurements were made with a slow enough sweep speed to satisfy the bandwidth concerns of the FCC. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_eff is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

If there are no detectable emissions above the noise floor, the data included may show noise floor measurements for reference only.

FREQUENCY STABILITY

XMIT 2019.05.15

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

TEST EQUIPMENT

Description	Manufacturer	Model	ID	Last Cal.	Cal. Due
Power Supply	Kikusui	PWR401ML	TQL	NCR	NCR
Meter - Multimeter	Fluke	117	MLS	23-Jan-17	23-Jan-20
Chamber - Temperature/Humidity	Cincinnati Sub Zero (CSZ)	ZPH-32-3.5-SCT/AC	TBF	NCR	NCR
Thermometer	Omega Engineering, Inc.	HH311	DUB	10-Nov-17	10-Nov-20
Generator - Signal	Agilent	E4422B	TGQ	15-Mar-18	15-Mar-21
Cable	ESM Cable Corp.	TTBJ141 KMKM-72	MNU	11-Apr-19	11-Apr-20
Block - DC	Fairview Microwave	SD3379	AMI	7-Sep-18	7-Sep-19
Analyzer - Spectrum Analyzer	Keysight	N9010A (EXA)	AFQ	13-Dec-18	13-Dec-19

TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The transmit frequency was set to the required channels in each band. The transmit power was set to its default maximum.

The 99% occupied bandwidth of the entire span of the FMCW transmit frequency was measured using a peak detector and a max hold to determine the frequency stability. The sweep speed on the spectrum analyzer was slowed enough to make sure no decrease in sensitivity or resolution would apply from when an IF amplifier is sweeping an CW signal. The formula to ensure this is:

$$B_{eff} = B * \sqrt{1 + \left(\frac{2 * \ln(2)}{\pi}\right)^2 * \left(\frac{F_s}{T_s * B^2}\right)^2}$$

Where B_{eff} is the effective bandwidth in Hz, B is the bandwidth in Hz, F_s is the sweep width in Hz, and T_s is the sweep time in S.

The requirement is for the transmit frequency to remain in the authorized band across a voltage variation of +/-15% of the nominal DC voltage and across a temperature variation of +50°C to -20°C in 10°C steps.

The lower edge of the 99% OBW for each measurement condition was compared against the lower edge of the authorized band to determine compliance. The upper edge of the 99% OBW for each measurement condition was compared against the upper edge of the authorized band to determine compliance.
