CONFIGURATION OF EUT

The Equipment Under Test (EUT) consists of:

Description	Applicant (Manufacturer)	Model No. (Serial No.)	FCC ID
Microwave Oven	Sharp Corporation (Sharp Appliances (Thailand) Ltd.)	KSA-8574A (--)	APYDMR0113

The measurement was carried out with the following equipment connected:

Description	Grantee/Distributor	Model No. (Serial No.)	FCC ID
None			

Type of Interference Cable(s) and the AC Power Cord used with the EUT:

No.	Cable	Shielded	Ferrite Core	Length
1	AC Power Cord (EUT) with 3-pin plug	NO	NO	1.2m

Operation - mode of the EUT:

The EUT was operated during the measurement under following load condition according to Sec.4.1 in FCC/OET MP-5 (1985).

- 1) Radiated Emissions Measurement (9 kHz - 30 MHz)
1050ml of water, with the beaker located in the center of the removable turntable.
- 2) Radiated Emissions Measurement (30 MHz - 1000 MHz)
1050ml of water, with the beaker located in the center of the removable turntable.
- 3) Radiated Emissions Measurement (1 GHz - 26 GHz)
General radiated emissions : 1050ml of water, with the beaker located in the center of the removable turntable.
Second and third harmonics : Two loads, one of 1050ml and the other of 450ml, of water are used. Each load is tested both with the beaker located in the center of the removable turntable and with it in the right front center.
- 4) ISM Frequency Measurement
1500ml of water in the beaker located in the center of the removable turntable.
- 5) RF Power Output Measurement
1500ml of water in the beaker located in the center of the removable turntable.

Test system:

The EUT is a microwave oven intended for the household use.
There is not any interface port on the EUT.

Detailed the Magnetron:

Cat. No. 2M253H(L) (manufactured by Toshiba Corporation)

The used (generated) frequencies in the EUT:

Magnetron : 2450 MHz
CPU : 4 MHz

EUT Modification

- - No modifications were conducted by JQA to achieve compliance to the applied levels.
- - To achieve compliance to the applied levels, the following change(s) were made by JQA during the compliance test.

The modification(s) will be implemented in all production models of this equipment.

SUMMARY

GENERAL REMARKS :

The EUT was tested according to the requirements of FCC Rules and Regulations Part 18 Subpart A, B and C (September 5, 1985) under the test configuration, as shown in page 15.

The conclusion for the test items of which are required by the applied regulation is indicated under the final judgement.

FINAL JUDGEMENT :

The "as received" sample;

- - fulfill the test requirements of the regulation mentioned on page 3.
- - fulfill the test requirements of the regulation mentioned on page 3, but with certain qualifications.
- - doesn't fulfill the test regulation mentioned on page 3.

Begin of testing : February 9, 1999

End of testing : April 22, 1999

Preliminary Test and Test-setup(Drawings)

Radiated Emission (Magnetic Field) 9 kHz - 30 MHz:

The preliminary test was performed according to the description of FCC/OET MP-5 (1985) Sec.5.1 (Preliminary Radiated Emissions Tests) and Sec.5.2 (Equipment Configurations), the preliminary test was carried out to investigate the frequency of the emission that has the highest amplitude relative to the limits within normal operating modes, cable positions and a typical system configuration. In order to find out to the maximum emission, the preliminary test and a final test were performed in accordance with the following steps.

Step 1: One operation mode of the test system was setting.

Step 2: In order to investigate the frequencies of maximum emissions, the loop antenna position was approached to the EUT and the significant frequency of the emission's circumstance from the test system were investigated. These data were recorded in the specified frequency band (9 kHz - 30 MHz).

Step 3: Using a test receiver and a loop antenna, the emission's circumstance from the test system was measured in according with FCC/OET MP-5 (1985) Sec.5.6 (Final Radiated Emissions Tests) at each frequency which was found the higher emission referred to level vs. frequency on the list and which was measured by the loop antenna.

Step 4: Return to step 1, if the other operation mode was possible to be setting.

Step 5: The worst result was reported arranging data of which was obtained and performed by one or plural operation modes as the final test.

At the worst point that has the highest amplitude relative to the limit the repeatability of the level was reconfirmed. The photographs of the tests system setup on the worst point were taken and recorded.

Radiated Emission (Electric Field) 30 MHz - 1000 MHz:

The preliminary test was performed according to the description of FCC/OET MP-5 (1985) Sec.5.1 (Preliminary Radiated Emissions Tests) and Sec.5.2 (Equipment Configurations), the preliminary test was carried out to investigate the frequency of the emission that has the highest amplitude relative to the limits within normal operating modes, cable positions and a typical system configuration. In order to find out to the maximum emission, the preliminary test and a final test were performed in accordance with the following steps.

Step 1: One operation mode of the test system was setting.

Step 2: Using a test receiver and a test antenna probe, the significant frequency of the emission's circumstance from the test system were investigated. These data were recorded every one of 22 divided bands in the specified frequency band (30 MHz - 1000 MHz).

Step 3: Using a test receiver and a resonant tuned dipole antenna, the emission's circumstance from the test system was measured in according with FCC/OET MP-5 (1985) Sec.5.6 (Final Radiated Emissions Tests) at each frequency which was found the higher emission referred to level vs. frequency on the list and which was measured by the resonant tuned dipole antenna.

Step 4: Return to step 1, if the other operation mode was possible to be setting.

Step 5: The worst result was reported arranging data of which was obtained and performed by one or plural operation modes as the final test.

At the worst point that has the highest amplitude relative to the limit the repeatability of the level was reconfirmed. The photographs of the tests system setup on the worst point were taken and recorded.

Radiated Emission (Electric Field) 1 GHz - 26 GHz:

The preliminary test was performed according to the description of FCC/OET MP-5 (1985) Sec.5.1 (Preliminary Radiated Emissions Tests) and Sec.5.2 (Equipment Configurations), the preliminary test was carried out to investigate the frequency of the emission that has the highest amplitude relative to the limits within normal operating modes, cable positions and a typical system configuration. In order to find out to the maximum emission, the preliminary test and a final test were performed in accordance with the following steps.

Step 1: One operation mode of the test system was setting.

Step 2: In order to investigate the frequencies of maximum emissions, the horn antenna position was approached to the EUT and the significant frequency of the emission's circumstance from the test system were investigated. These data were recorded in the specified frequency band (1 GHz - 26 GHz).

Step 3: The emission's circumstance from the test system was measured in accordance with FCC/OET MP-5 (1985) Sec.5.6 (Final Radiated Emissions Tests) at each frequency which was found higher emission referred to level vs. frequency on the list and which was measured in the specified distance using the horn antenna.

Step 4: Return to step 1, if the other operation mode was possible to be setting.

Step 5: The worst result was reported arranging data of which was obtained and performed by one or plural operation modes as the final test.

At the worst point that has the highest amplitude relative to the limit the repeatability of the level was reconfirmed. The photographs of the tests system setup on the worst point were taken and recorded.

Sample of calculated result at 719.0 MHz, as the Minimum Margin point:

Antenna Factor = 26.7 dB(1/m)

Cable Loss = 3.7 dB

Conversion Factor = -29.5 dB (-20dB/decade)

+) Meter Reading = <-10.0 dB(μV)

Result = < -9.1 dB(μV/m) at 300 m

Minimum Margin : $20\log(33.7/10^{<-9.1/20}) = 20\log(33.7/0.35) = >39.7$ (dB)

The point shown on " " is the Minimum Margin Point.

Note 1:

1) The highest frequency generated or used in the EUT: 2.45 GHz

2) The upper frequency of measurement range : 24.5 GHz

3) The limits at 300 m were conducted as the RF power 908.9 W : $25 \times \sqrt{908.9/500} = 33.7$ (μV/m)

RF Power Output Measurement ISM Frequency Device

Test Date: February 9, 1999
Temp.: 20 °C ; Humi.: 54 %

The power output was measured by the calorimetric method, computing the power output from the observed temperature rise of the load over a period of time.

Results of RF Output Power : 908.9 W

The limit of the radiated emission at 300 m : $25 \times \sqrt{908.9/500} = 33.7$ ($\mu\text{V/m}$)
