ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC CFR 47 Part 2 and FCC CFR 47 Part 27. The sample tested was found to comply with the requirements defined in the applied rules.

1.1 INTRODUCTION

The information contained in this report is intended to show the verification of FCC Testing of the Sharp SHL25 Dual-band CDMA (BC0, BC6) & Quad-band GSM (GSM850/GSM900/DCS1800/PCS1900) & Dual-band UMTS (FDD I, FDD V) & Quad-band LTE (B1, B3, B17, B18) & AXGP (TDD 41) multi mode cellular phone with Bluetooth, ANT+, WLAN, SRD (NFC, FeliCa) and GPS to the requirements of FCC CFR 47 Part 2 and FCC CFR 47 Part 27.

Objective	To perform FCC Testing to determine the Equipment Under Test's (EUT's) compliance with the Test Specification, for the series of tests carried out.
Manufacturer	Sharp Corporation
Model Number(s)	SHL25
Serial Number(s)	IMEI 004401115170223

1.3 PRODUCT TECHNICAL DESCRIPTION

Please refer to the SHL25 Model Description Form.

1.4 PRODUCT INFORMATION

1.4.1 Technical Description

The Equipment Under Test (EUT) was a Sharp SHL25 Dual-band CDMA (BC0, BC6) & Quad-band GSM (GSM850/GSM900/DCS1800/PCS1900) & Dual-band UMTS (FDD I, FDD V) & Quad-band LTE (B1, B3, B17, B18) & AXGP (TDD 41) multi mode cellular phone with Bluetooth, ANT+, WLAN, SRD (NFC, FeliCa) and GPS. A full technical description can be found in the manufacturer's documentation.

1.5 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure.

The EUT was powered from a 4.0 V DC supply.

FCC Measurement Facility Registration Number
90987 Octagon House, Fareham Test Laboratory

1.6 DEVIATIONS FROM THE STANDARD

No deviations from the applicable test standard were made during testing.

1.7 MODIFICATION RECORD

Modification 0 - No modifications were made to the test sample during testing.

2.1.3 Date of Test

13 April 2014 & 22 April 2014

2.1.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.1.5 Test Procedure

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 27.50, Part 2.1046 and KDB 971168.

Carrier Power

The path loss between the EUT and the Power Meter was measured using a Network Analyser. The EUT was connected to a wideband RF average Power Meter via a cable, attenuator and combiner. The recorded path loss was entered as an offset on the Power Meter. The other port of the combiner was connected to a wideband communications tester.

Measurements were performed with the EUT operating at maximum power on bottom, middle and top frequencies on QPSK and 16QAM modulation schemes with all resource blocks and a single resource block positioned at the low, middle and high position for each channel bandwidth.

The average power was then recorded as shown in the tables below.

Peak to Average Ratio

The path loss between the EUT and the Spectrum Analyser was measured using a Network Analyser. The EUT was connected to a Spectrum Analyser via a cable, attenuator and combiner. The recorded path loss was entered as a reference level offset on the Spectrum Analyser. The other port of the combiner was connected to a wideband communications tester.

Using the CCDF of the spectrum analyser and the procedure defined in KDB 97118, section 5.7.1, the peak to average ratio was recorded, the measurement was repeated ten times and the highest result was recorded as shown in the tables below.

Measurements were performed with the EUT operating at maximum power on bottom, middle and top frequencies on QPSK and 16QAM modulation schemes with all resource blocks and a single resource block positioned at the low, middle and high position for each channel bandwidth.

Product Service

Effective Radiated Power

Measurements of the fundamental from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations. The fundamental frequency was maximised by adjusting the antenna height, antenna polarisation and turntable azimuth. A peak detector was used with the trace set to max hold. The maximum result was recorded.

The mast and controller were then returned to the positions which gave the maximum result. The Spectrum Analyser detector was set to rms and configured to integrate the power over the entire emission bandwidth to give the total output power.

The EUT was then removed from the chamber and replaced with a substitution antenna. Using a signal generator the level was adjusted to achieve the same value on the measuring instrument as previously recorded with the EUT. The final result (ERP) was determined by a calculation using the signal generator level, antenna gain and cable loss.

Measurements were performed in the configuration that yielded the highest conducted RF output power for every supported modulation scheme on each bandwidth, as determined in the tables below. The measurements were performed at a 3m distance unless otherwise stated.

2.3.3 Date of Test

11 April 2014 & 13 April 2014

2.3.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.3.5 Test Procedure

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 27.53, Part 2.1049 and KDB 971168.

99% Occupied Bandwidth and 26 dB Bandwidth

The Spectrum Analyser was configured to measure the Occupied Bandwidth of the EUT using the 99% Occupied Bandwidth measurement function. The 26 dB bandwidth was also measured using the relative measurement procedure described in KDB 971168, section 4.1. The EUT was tested on bottom, middle and top channels, on all channel bandwidths for each supported modulation scheme with all resource blocks and a single resource block positioned at the resource block offset that yielded the highest conducted RF output power within the channel bandwidth.

Band Edge

The path loss between the EUT and Spectrum Analyser was measured using a Network Analyser and entered as a reference level offset. The EUT was set to transmit on maximum power using a wideband radio communications tester. The EUT was tested with all resource blocks active and with one resource block active at the position closest to the band edge on both the bottom and top channel. The RBW was set to a value of at least 1% of the Occupied Bandwidth value. The detector of the Spectrum Analyser was set to rms and the result checked against the -13 dBm limit defined in the specification. The results are shown in the following summary tables and plots.

Conducted Spurious Emissions

The path loss between the EUT and Spectrum Analyser was measured using a Network Analyser. The EUT was connected to the spectrum analyser via a cable, combiner and attenuator. At frequencies greater than 1.5 GHz, a high pass filter was also used. The other port of the combiner was connected to a wideband radio communications test set.

Product Service

The frequency spectrum was investigated from 9 kHz to 8 GHz. The EUT was set to transmit on full power with QPSK and 16QAM modulation schemes. The EUT was tested on bottom, middle and top channels, on all channel bandwidths for each supported modulation scheme with all resource blocks and a single resource block positioned at the resource block offset that yielded the highest conducted RF output power within the channel bandwidth. The resolution and video bandwidths were set to 100 kHz and 300 kHz thus meeting the requirements of Part 27.53(g). The spectrum analyser detector was set Peak and the trace to Max Hold.

The maximum path loss across the measurement bands were used as reference level offsets to ensure worst case.

Radiated Emissions

A preliminary profile of the Spurious Radiated Emissions was obtained up to the 10th harmonic by operating the EUT on a remotely controlled turntable within a semi-anechoic chamber. Measurements of emissions from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations. The profiling produced a list of the worst-case emissions together with the EUT azimuth and antenna polarisation.

Using the information from the preliminary profiling of the EUT, the list of emissions was then confirmed or updated under Alternative Open Site conditions. Emission levels were maximised by adjusting the antenna height, antenna polarisation and turntable azimuth.

Measurements were performed in the configuration that yielded the highest conducted RF output power for every supported modulation scheme on each bandwidth.

For any emissions found the EUT was then removed from the chamber and replaced with a substitution antenna. Using a signal generator the level was adjusted to achieve the same value on the measuring instrument as previously recorded with the EUT. The final result was determined by a calculation using the signal generator level, antenna gain and cable loss.

The measurements were performed at a 3m distance unless otherwise stated.

2.4 FREQUENCY STABILITY

2.4.1 Specification Reference

FCC CFR 47 Part 2, Clause 2.1055
FCC CFR 47 Part 27, Clause 27.54

2.4.2 Equipment Under Test and Modification State

SHL25 S/N: IMEI 004401115170678 - Modification State 0

2.4.3 Date of Test

30 April 2014

2.4.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.4.5 Test Procedure

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 27.54 and FCC CFR 47 Part 2.1055.

The EUT was configured to transmit at maximum output power on the middle channel with QPSK and 16QAM modulation, with a 10 MHz bandwidth and all resource blocks active using a communications test set. The communications test set was connected to an external 10 MHz rubidium frequency standard to increase accuracy of the measurement. The Tx measurement function of the communications tester was then used and the maximum frequency error was then recorded.

Measurements were repeated over the temperature range of +50°C to -30°C in 10°C steps and at +20°C the voltage was varied to the maximum and minimum end point voltages as declared by the manufacturer.

2.4.6 Environmental Conditions

Ambient Temperature	22.8°C
Relative Humidity	41.5%

2.4.7 Test Results

4.0 V DC Supply

Frequency Stability
