The EUT is based on the Bluetooth SPEC. V1.1 and CF Card Rev. 1.4.

The specification is as following :

Frequency characteristics	: 2402MHz through 2480MHz
No. of channels / channel spacing	: 79 channels / 1MHz channel spacing

6 SUMMARY OF TESTS

6.1 §15.207 Conducted Emissions

Test Procedure

EUT was placed on a platform of nominal size, 1m by 1.5m, raised 80cm above the conducting ground plane. The rear of tabletop was located 40cm to the vertical conducting plane. The rear of EUT, including peripherals aligned and flush with rear of tabletop. All other surfaces of tabletop was at least 80cm from any other grounded conducting surface. I/O cables and AC cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged at a 40cm height to the ground plane. Each EUT current-carrying power lead, except the ground (safety) lead, were individually connected through a LISN to the input power source. All unused 50ohm connectors of the LISN were resistively terminated in 50ohm when not connected to the measuring equipment.

The AC Mains Terminal Continuous disturbance Voltage has been measured with the EUT on a shielded room. The EUT was connected to a Line Impedance Stabilization Network (LISN).

An overview sweep with peak detection has been performed.

The measurements have been performed with a CISPR quasi-peak detector (IF BW 10kHz) .

6.2 §15.247(a)(1) Frequency Hopping Systems

Bluetooth Module uses 79 channels, each 1MHz wide.

On average, each channel is used equally.

6.3 §15.247(a)(1)(ii) Channel Utilization

The total number of channels is 79.

Dwell time

Spectrum analyzer was set as center frequency 2402MHz, zero span and dwell time 30sec.

As a result of observation with Bluetooth module was on hopping condition, 95 times hopping were appeared per 1 channel.

Maximum transmit ON time per appeared hopping is 2.89ms(DH5).

Therefore accumulated maximum transmit ON time per channel for 30sec is as follows:

$$2.89\text{ms} \times 95 = 274.55\text{ms} < 400\text{ms}$$

6.4 § 15.247(b) Maximum Peak Out Put Power(Radiated)

Test Procedure

EUT was placed on a platform of nominal size, 1m by 1.5m, raised 80cm above the conducting ground plane. I/O cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged 40cm height to the ground plane. Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength.

The Radiated Electric Field Strength intensity has been measured on an open test site with a ground plane and at a distance of 3m.

The measuring antenna height was varied between 1 to 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization.

For the EUT, turn table was rotated against to three orthogonal axes then receive antenna was move up and down in order to find maximum emission point.

The point which is indicated in attached photograph(Page 15) was found as maximum emission point.

Test data : APPENDIX A7 to A10

Photographs of test setup : Page15

Test result : Pass

Test instruments : SA-06, HA-01, AF-04

6.5 § 15.247(b) Maximum Peak Out Put Power(Conducted)

Test Procedure

The Maximum Peak Output power was measured with a power meter connected to the antenna port.

According to FCC 15.31(e), frequency change, same as power level when power supply voltage of host PC was changed 85%(AC102V)~115%(AC138V), was confirmed by spectrum analyzer.

Both of power level and frequency were not changed at all.

* Antenna Gain dose not exceed 6dBi.

6.6 § 15.247(c) Out of Band Emissions(Radiated)

Test Procedure

EUT was placed on a platform of nominal size, 1m by 1.5m, raised 80cm above the conducting ground plane. I/O cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged 40cm height to the ground plane. Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength. The Radiated Electric Field Strength intensity has been measured on an open test site with a ground plane and at a distance of 1m and 3m.

*Test distance 3m : 30MHz to 10GHz / 1m : 10GHz to 26GHz

The measuring antenna height was varied between 1 to 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization.

For the EUT, turn table was rotated against to three orthogonal axes then receive antenna was move up and down in order to find maximum emission point.

The point which is indicated in attached photograph(Page 15) was found as maximum emission point.

Radiated Spurious emissions

In any 100kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator confirmed 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, based on a radiated measurement. The result was also satisfied the general limits specified in Sec.15.209(a).

Sample Calculation :

RESULT=Reading + ANT Factor - Amp Gain + CABLE LOSS

Except for the above table : All other spurious emissions are more than 20dB below the limit.

* Test Distance 1m, 1m Limit=3m Limit(54dB)+20log(3/1)

The point don't use high pass filter.
