ADDENDUM TO TEST REPORT 95673-6

Sensor
Model: RS-2b/SU-2b

Tested To The Following Standards:

FCC Part 15 Subpart C Section(s): 15.207 and 15.247

Report No.: 95673-6A

Date of issue: June 26, 2014

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Revision History

Original: Testing of Sensor, RS-2b/SU-2b to FCC Part 15.207 and 15.247.
Addendum A: Section 15.31e statements were revised.

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

The EUT is a Sensor. It is powered at 14VDC by DC Power Supply which sits next to it. The EUT is considered a component of the Enlighted system, and it acts as sensors for occupancy, ambient light, and temperature. In order to monitor the EUT and control the EUT by an application "Putty", the EUT is connected to the laptop which is outside the chamber by a RS 232 cable. The EUT is set continuously transmit.

Test Conditions / Notes:

Conducted Emission

Frequency Range: 150kHz to 30MHz

Firmware Used: Version 2.6.2

Application: PuTTY

Temperature: 21.3°C

Humidity: 43 %

Atmospheric Pressure: 101.0 kPa

High Clock: 16MHz

Transmitting operating frequency= 2.4GHz Band

RF Output= 0dBm

Gain of the antenna= 0dBi

The EUT is a Sensor. It is powered at 14VDC by DC Power Supply which sits next to it. The EUT is considered a component of the Enlighted system, and it acts as sensors for occupancy, ambient light, and temperature.

In order to monitor the EUT and control the EUT by an application "PuTTY", the EUT is connected to the laptop which is outside the chamber by RS 232 cable. The EUT is set continuously transmit.

Ext Attn: 0 dB

Measurement Data:

Reading listed by margin.

Test Conditions / Notes:

Firmware Used: Version 2.6.2

Application: PuTTY

Temperature: 21.3°C

Humidity: 43 %

Atmospheric Pressure: 101.0 kPa

High Clock: 16MHz

Transmitting operating frequency = 2.4GHz Band

RF Output $\approx$ 0dBm

Gain of the antenna = 0dBi

The EUT is a Sensor. It is powered at 14VDC by DC Power Supply which sits next to it. The EUT is considered a component of the Enlighted system, and it acts as sensors for occupancy, ambient light, and temperature. In order to monitor the EUT and control the EUT by an application "PuTTY", the EUT is connected to the laptop which is outside the chamber by RS 232 cable. The EUT is set continuously transmitting

15.31(e). Adjusted the DC voltage : +/- 15% of the manufacturer declared nominal rated supply voltage of 12VDC to 24VDC (i.e., 10.2VDC and 27.6VDC), the Fundamental power level remains unchanged

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

The reported measurement uncertainties are calculated based on the worst case of all laboratory environments from CKC Laboratories, Inc. test sites. Only those parameters which require estimation of measurement uncertainty are reported. The reported worst case measurement uncertainty is less than the maximum values derived in CISPR 16-4-2. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dB μ V/m, the spectrum analyzer reading in dB μ V was corrected by using the following formula. This reading was then compared to the applicable specification limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBμV)
+	Antenna Factor	(dB)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBμV/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or carrot ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
