1.3 **Product Description**

Breeze Compact 2.5G Base station is a high capacity, IP services oriented Broadband Wireless Access system.

Breeze Compact 2.5G is digital modulated TDD system covering 2496 MHz up to 2690 range. The system contains an all outdoor base station unit.

The basic base station system configuration is contains power supply, MODEM and based on RF IC radio.

The following describes the transmit path and receive path of the Breeze Compact 2.5G.

Note: The ODU consists of four identical RF radio paths based on two identical RF IC chipsets, all paths terminated with antenna ports. Only two radio paths that based on one RF IC are described in the detailed block diagram.

The DC voltage applied to the final RF amplifying device is 28VDC.

Transmit mode:

The signal flow in transmit mode is as follows: The IQ signal passes from the Modem to radio part, and converted to required RF frequency by RF IC then the signal passes thru combo Balun+BPF, GVA-63+ and MGA635P8 amplifiers, amplified again by MGA-22033, then passes thru cable to high power card and amplified again by BLF6G27-10G and BLF7G27L-90P.

The amplified signal passes thru circulator and cavity filter (2496-2690MHz) directly to antenna port.

Receive mode:

The signal flow in the receive mode is as follows: The unit antenna receives the signal. The received signal passes thru cavity filter (2496-2690MHz), circulator and TX/RX switch. The LNA MGA635P8, combo Balun+BPF directly to the RF IC, converted to IQ signal and directed to the Modem.

1.4 **Test Methodology**

Radiated testing was performed according to the procedures in ANSI C63.4: 2003. Radiated testing was performed at an antenna to EUT distance of 3 meters.

1.5 **Test Facility**

The radiated emissions tests were performed at I.T.L.'s testing facility at Kfar Bin-Nun, Israel. This site is a FCC listed test laboratory (FCC Registration No. 90715, date of listing 21 November 2012).

I.T.L.'s EMC Laboratory is also accredited by A2LA, certificate No. 1152.01.

2. System Test Configuration

2.1 *Justification*

The base station continuously transmitted during the tests while communicating with a subscriber unit for configuration purposes only.

The compact 3000 2496-2690MHz units containing 4 identical and independent TX & RX chains.

In 4X4 1 carrier 1 sector configuration all TX & RX chains are transmitting/receiving on the same freq.

In 2X4 1 carrier 1 sector configuration only 2 TX & 4 RX chains are transmitting/receiving on the same freq.

In 4X4 2 carrier 1 sector configuration all TX & RX chains are transmitting/receiving on 2 different freq.

In 4X4 2 carrier 2 sector configuration all TX & RX chains are transmitting/receiving on 2 different freq on 2 different geographical area.

In all configurations the RF parameters and performances are identical.

Due to the similarity of the RF chains, tests were performed only on one port, except peak output power test which was repeated for each RF port independently.

The base station was configured to transmit at maximum output power rate in the frequency band 2496 MHz to 2690 MHz with two bandwidths (5 and 10 MHz) at three representative channels and three modulations.

The unit is powered from 48 VDC.

2.2 *EUT Exercise Software*

Compact 2.x Software Release 5.1 software was used.

2.3 *Special Accessories*

No special accessories were needed in order to achieve compliance.

2.4 *Equipment Modifications*

No modifications were necessary in order to achieve compliance.

2.5 Configuration of Tested System

Note: Each antenna port was tested separately connected via the coupler to the subscriber unit and spectrum analyzer.

4.1 Test Specification

FCC Part 27, Sub-part C (27.50(h)(1))

4.2 Test procedure

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable, coupler, and DC block. Including the duty cycle (see Figure 45 to Figure 46), the external gain was -40.01 dB. The E.U.T. RF output was OFDMA modulated with QPSK, 16QAM and 64QAM, at 5 MHz BW.

Special attention was taken to prevent Spectrum Analyzer RF input overload. Tested frequencies: 2498.5 MHz, 2593.0 MHz and 2687.5 MHz

According to 47 CFR Part 2 section § 2.1046 and Part 27 section § 27.50(h)(1), the maximum EIRP of a base station shall not exceed $63 + 10 \log (X/Y)$ dBW, where X is the actual channel width in MHz and Y is either 6 MHz if prior to transition or the station is in the MBS following transition or 5.5 MHz if the station is in the LBS and UBS following transition.

As to the limit, the X is 10 MHz and Y is 6 MHz for the EUT, so the limit is calculated to be $63 + 10 \log (5 \text{ MHz}/6 \text{ MHz}) = 62.2 \text{ dBm}$.

Antenna type: Manual tilt panel antenna (Gain: 18 dBi) with N type connector.

7. Spectral Power Density 10 MHz Bandwidth

7.1 Test Specification

FCC Part 27, Sub-part C (27.50(h)(4))

7.2 Test procedure

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable, coupler, and DC block. Including the duty cycle (see Figure 45 to Figure 46), the external gain was -40.01 dB. The E.U.T. RF output was OFDMA modulated with QPSK, 16QAM and 64QAM, at 10MHz BW. Power spectral density was measured over 100 kHz RBW.

Special attention was taken to prevent Spectrum Analyzer RF input overload. Tested frequencies: 2501.00 MHz, 2593.00 MHz and 2685.00 MHz

Antenna type: Manual tilt panel antenna (Gain: 18 dBi) with N type connector.

The E.U.T. was set to the applicable test frequency with OFDMA modulations and 5 MHz bandwidth in the 2498.5-2687.5MHz

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable, coupler, and DC block.

FCC Part 27, Sub-part C, Section 27.53 (m)(2)

11.2 Test procedure

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at $43 + 10 \log (P)$ dB. The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable, coupler, and DC block. Including the duty cycle (see Figure 45 to Figure 46), the external gain was -40.01 dB.

14. Spurious Radiated Emission 5 and 10 MHz Bandwidth

14.1 Test Specification

FCC, Part 27, Sub-part C Section 27.53 (g)

14.2 Test Procedure

The test method was based on ANSI/TIA-603-B: 2002, Section 2.2.12

Unwanted Emissions: Radiated Spurious.

The power of any emission outside of the authorized operating frequency ranges (2489.50-2687.50 MHz) must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log (P)$ dB, yielding -13dBm .

- (a) The E.U.T. operation mode and test set-up are as described in Section 3.
A preliminary measurement to characterize the E.U.T was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in Figure 1.
The frequency range 9 kHz-27 GHz was scanned, and the list of the highest emissions was verified and updated accordingly.
The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.
- (b) The E.U.T. was replaced by a substitution antenna (dipole 30MHz-1GHz, Horn Antenna above 1GHz) driven by a signal generator. The height was readjusted for maximum reading. The signal generator level was adjusted to obtain the same reading on the EMI receiver as in step (a).
The signals observed in step (a) were converted to radiated power using:

$$P_d(\text{dBm}) = P_g(\text{dBm}) - \text{Cable Loss (dB)} + \text{Substitution Antenna Gain (dB)}$$

$$P_d = \text{Dipole equivalent power (result).}$$

$$P_g = \text{Signal generator output level.}$$

The E.U.T. was operated at the frequency of 2498.00, 2593.00, and 2685.00 MHz with QPSK, 16QAM, and 64QAM modulations with 5 MHz bandwidth and frequency of 2501.00, 2593.00, and 2685.00 MHz with QPSK, 16QAM, and 64QAM modulations with 10 MHz bandwidth.

The worst case results using 64QAM modulation and both 5 and 10 MHz bandwidth were recorded.

14.3 Test Results

JUDGEMENT: Passed by 16.80 dB (5 MHz Bandwidth)

JUDGEMENT: Passed by 21.10 dB (10 MHz Bandwidth)

The E.U.T met the requirements of the FCC, Part 27, Sub-part C, Section 27.53 (g) specifications.

The spectrum analyzer was set to 10.0 kHz span and 1.0 kHz RBW, and 1.0 kHz VBW.

The carrier frequency was measured and recorded (reference frequency reading).

The carrier frequency measurement was repeated for:

- (a). -30°C and 48 VDC
- (b). -20°C and 48 VDC
- (c). -10°C and 48 VDC
- (d). 0°C and 48 VDC
- (e). +10°C and 48 VDC
- (f). +20°C and 48 VDC
- (g). +40°C and 48 VDC
- (h). +50°C and 48 VDC

The carrier frequency was measured and recorded after at least 20 minutes of exposing the E.U.T. to the temperature.

The E.U.T. was operated at 2498.50 and 2687.50 MHz for 5 MHz bandwidth, and 2501.00 and 2685.00 MHz for 10 MHz bandwidth.
