Section 2.1053 MEASUREMENT REQUIRED: FIELD STRENGTH OF SPURIOUS RADIATION

The ASSONEBTS-11 UMTS CDMA transceiver was configured in both cdma2000 (3G-1x) mode with pilot, page, sync and traffic channels per 3GPP2 cdma2000 standards and IS-856 (3G-1xEV) mode with pilot, MAC and data channels per 3GPP2 High Rate Packet Data standards. The system was configured as a “six-sector” base transceiver station, with three sectors cdma2000 (3G-1X) modulation (four cdma2000 carriers per transmit port, 12 cdma2000 carriers total) and three sectors IS-856 (3G-1xEV) modulation (two IS-856 carriers per transmit port, six IS-856 carriers total). The carrier power level at each transmit port end antenna connector (EAC) of the ASSONEBTS-11 UMTS CDMA transceiver Base Transceiver Station (BTS) was transmitting to the maximum rated mean power (25 watts per carrier, maximum 100 watts with four carriers).

Measurements were made using both horizontally and vertically polarized broadband antennas. Per FCC regulations, the comparison of out of band spurious emissions directly to the limit is appropriately made using the substitution method. However, when the emissions are more than 20 dB below the specification limit, the use of field strength measurements for compliance determination is acceptable and those emissions are considered not reportable (Section 2.1053 and the FCC Interpretive database for 2.1053). For this case the evaluation of acceptable radiated field strength is as follows.

$$E(\text{dBuV/m}) = V_{\text{meas}}(\text{dBuV}) + \text{Amplifier Gain / Cable Loss (dB)} + \text{Antenna Factor}$$
$$E = (120\pi P)^{1/2} = [(30 * P)^{1/2}] / R$$

Where: E = Field Intensity in Volts/ meter R = Distance in meters = 3 m
P = Transmitted Power in watts = 25 W/ Carrier

Frequency of Emission (MHz)	Distance (m)	E (dBuV/m)	E (dBm)	RBW
10-10,000	3	84.1	-22.9	100 kHz

Sections 2.1051 and 2.1057 (c) specify that the spurious emissions attenuated more than 20 dB below the permissible value need not be reported. Therefore, the reportable limit at 3 meters is 64.1 dBuV/m (-42.9 dBm).

All measurement equipment used was calibrated in accordance with ISO9000 processes. The EUT configuration diagram is given in the following Figure 10.6.1.

Figure 10.6.1 EUT for Measurements of FIELD STRENGTH OF SPURIOUS RADIATION

Results

The measurement results over the frequency spectrum investigated (10 MHz to 10 GHz) demonstrate full compliance with the Rules of the Commission.

Worst Case FIELD STRENGTH OF SPURIOUS RADIATION

Frequency (MHz)	Antenna Polarity	Measured Radiated Field Strength (dBm)	Measure Radiated Field Strength (dBuV/m)	Path Gain Amp/Cable (dB)	Antenna Factor (dB)	Equivalent Transmit Power (dBm)	Equivalent Field Strength (dBuV/m)	Pass / Fail
27.2	H	-51.0	56.0	24.34	8.89	-66.46	40.54	Pass
77.6	H	-48.90	58.1	23.48	9.53	-62.85	44.15	Pass
978.0	H	-65.6	41.4	16.73	24.04	-58.29	48.71	Pass
1769	V	-54.3	52.7	36.2	28.38	-62.12	44.88	Pass
3049	H	-57.0	50.0	35.25	32.31	-59.94	47.06	Pass
7637	V	-67.2	39.8	34.97	39.74	-62.34	44.66	Pass

FCC ID: AS5ONEBTS-11

FIELD STRENGTH OF SPURIOUS RADIATION Plots – 200 to 1000 MHz

FIELD STRENGTH OF SPURIOUS RADIATION Plots -1 to 2.5 GHz

FIELD STRENGTH OF SPURIOUS RADIATION Plots – 2.5 to 5 GHz

FIELD STRENGTH OF SPURIOUS RADIATION Plots -5 to 10 GHz

Section 2.1055 MEASUREMENT REQUIRED: FREQUENCY STABILITY

The output frequency of the AS5ONEBTS-11 UMTS CDMA transceiver is determined by the internal transmit synthesizer and the external OM. The 15 MHz output frequency of OM is disciplined by the CTU using Bell Laboratories proprietary phase lock loop (PLL) software and GPS reference.

The stability of the AS5ONEBTS-11 UMTS CDMA transceiver output frequency was measured at the transmit port end antenna connector (EAC) from -40°C to $+50^{\circ}\text{C}$ in 10°C steps and with a variation of primary supply voltage from 85% to 115% of the nominal value per Section 2.1055. The nominal supply voltage is +24 VDC. The 85% of 24 VDC is 20.4 V and 115% is 27.6 V. The AS5ONEBTS-11 UMTS CDMA transceiver was set to transmit at CDMA Cellular Channel 425, 882.75 MHz. The frequency was measured at the radio output every 30 seconds at each temperature and each supply voltage. Seven data were collected at each temperature and each supply voltage.

At each temperature and each supply voltage, the AS5ONEBTS-11 UMTS CDMA transceiver was given sufficient time for its thermal stabilization. Thermal-couplers were attached to the MCR faceplate, CTU faceplate and the exterior surface of the Modular Cell. The primary OM was used for providing 15MHz reference frequency to the CTU. The temperature was recorded during the testing to ensure that the thermal stability was achieved at each temperature prior to frequency measurement.

The minimum requirement specified in Section 22.355 for CDMA Cellular transmitter is ± 1.50 ppm (i.e. maximum frequency error of 1303 Hz $\sim$ 1341 Hz). TIA/EIA specifies the minimum requirement is ± 0.050 ppm (i.e. maximum frequency error of 44 Hz).

The maximum measured frequency derivations (Δf) from 882.75MHz at each temperature and supply voltage are summarized in the following table.

Stabilized Temp. ($^{\circ}\text{C}$)	Δf 85% V_{norm} (Hz)	Δf 100% V_{norm} (Hz)	Δf 115% V_{norm} (Hz)
-40	2.656	1.278	1.342
-30	1.235	1.839	1.081
-20	2.459	1.237	1.042
-10	0.766	0.956	3.470
0	1.698	1.254	1.184
+10	1.336	1.776	0.947
+20	2.026	1.941	3.092
+30	2.440	1.340	0.623
+40	1.087	2.335	2.339
+50	1.617	2.146	0.821

All the measurement equipment was calibrated in accordance with ISO 9001 process. The EUT configuration diagram is given in the following.

Results:

The output frequency of the 850 MCR at the Channel 425 deviated from the 882.75 MHz by a maximum error of $6.04\text{E-}3$ ppm. The AS5ONEBTS-11 UMTS CDMA transceiver, subject of this application, demonstrate full compliance with the Rules of the Commission.

SET-UP FOR MEASUREMENT OF FREQUENCY STABILITY
