SAR Test Report: A1228c

Date of test: June 29, 2000

Laboratory: Electromagnetic Near Field and Radio Frequency Dosimetry Laboratory
Ericsson, Inc.
7001 Development Drive, P.O. Box 13969,
Research Triangle Park, NC, 27709, USA

Test Responsible: Mark Douglas, Ph.D.
Senior Staff Engineer, Antenna Development Group
mark.douglas@ericsson.com
(919) 472-6334

Statement of Compliance

Ericsson, Inc. declares under its sole responsibility that the that the product

Ericsson A1228c

to which this declaration relates, is in conformity with the appropriate RF exposure standards, recommendations and guidelines. It also declares that the product was tested in accordance with the appropriate measurement standards, guidelines and recommended practices. Any deviations from these standards, guidelines and recommended practices are noted below:

(none)

E

1. Introduction

In this test report, compliance of the Ericsson A1228c portable telephone with RF safety guidelines is demonstrated (applicable RF safety guidelines are given in [1]). The device was tested in accordance with the latest available test guidelines [1]. Detailed procedures of the test are described in the *Ericsson SAR Measurement Specification* [2].

2. Device Under Test

2.1 Antenna description

Type	Fixed stub	
Location	Left side	
Dimensions	length	30 mm
	width at base	10 mm
Configuration	Helix	

2.2 Device description

Device model	A1228c	
Serial number	UA201988XW	
Mode	800 AMPS	800 CDMA
Multiple Access Scheme	FDMA	FH-CDMA
Maximum Output Power Setting¹	26.0 dBm	23.5 dBm
Factory Tolerance in Power Setting	± 0.25	± 0.25
Maximum Peak Output Power²	26.25 dBm	23.75 dBm
Duty Cycle	1	1
Transmitting Frequency Range	824 – 837 MHz	824 – 837 MHz
Prototype or Production Unit	Prototype	

3. Test equipment

3.1 Dosimetric system

SAR measurements were made using the DASY3 professional system (software version 3.1c), manufactured by Schmid & Partner Engineering AG and installed February, 1998. The total SAR assessment uncertainty (K = 1) of the system is ±16% and includes a +15% offset (overestimation). The extended uncertainty (K = 2) is ±32% with a +15% offset. This results in a total uncertainty range of –1% to +31% for K = 1, or –17% to +47% for K = 2. The equipment list is given below.

Description	Serial Number	Due Date
DASY3 DAE V1	345	4/01
E-field probe ETDV5	1324	2/01
Dipole Validation Kit, D900V2	049	12/00

¹ This is the conducted power measured at the antenna port when the device is set to its highest power setting. It is measured at the middle of the transmit frequency band. Note that the output power may be different at other frequencies.

² This equals the maximum output power setting plus the factory tolerance.

E

3.2 Additional equipment

<u>Description</u>	<u>Serial Number</u>	<u>Due Date</u>
Signal Generator HP8648C	3537A01598	9/00
Dielectric probe kit HP 85070B	US33020256	8/00
Network analyzer HP 8752C	3410A03105	7/00
Power meter HP 437B	3125U13729	2/01
Power sensor HP 8482H	3318A07097	2/01
Tektronix CMD80	847946/048	2/01

4. Electrical parameters of the tissue simulating liquid

Prior to conducting SAR measurements, the relative permittivity, ϵ_r , and the conductivity, σ , of the tissue simulating liquids were measured with the dielectric probe kit. These values are shown in the table below. The mass density, ρ , entered into the DASY3 program is also given. Recommended limits for maximum permittivity, minimum conductivity and maximum mass density are also shown [3]. It is seen that the measured parameters result in an overestimation of SAR compared to the recommended values.

f (MHz)	Limits / Measured	Dielectric Parameters		
		ϵ_r	σ (S/m)	ρ (g/cm ³)
835	Measured	40.9	0.90	1.00
	Recommended Limits [3]	46.1	0.74	1.03

5. System accuracy verification

A system accuracy verification of the DASY3 was performed using the dipole validation kits listed in Section 3.1. The system verification test was conducted on the same day as the measurement of the DUT. The obtained results are displayed in the table below. It is seen that the system is operating within its specification, as the results are within $\pm 5\%$ of the reference values. Reference values are based on an analysis performed at the laboratory using the dielectric parameters specified below. The distributions of SAR compare well with those of the reference measurements (see Appendix 1).

f (MHz)	Measured / Reference	SAR (W/kg), 1 gram	Dielectric Parameters			Temp. (°C)
			ϵ_r	σ (S/m)	ρ (g/cm ³)	
900	Measured	10.6	40.2	0.96	1.00	24
	Reference	10.2	40.0	0.95	1.00	23

6. Test results

The measured SAR values and conducted output powers are shown in Table 1. For AMPS mode, the device was tested at the lowest, middle and highest frequencies of the transmit band. It was also tested on both the right-hand phantom (corresponding to the right side of the head) and the left-hand phantom. For CDMA mode, the maximum power is significantly lower than that of AMPS mode, therefore SAR values are also lower. Table 1 shows SAR results for CDMA mode for the single case that gives the highest SAR in AMPS mode. The SAR results shown are maximum SAR values averaged over 1 g of tissue.

A base station simulator was used to control the device during the SAR measurements. The phone was supplied with a fully-charged battery for the tests. The temperature of the test facility during the tests was 24.5 ± 1 °C, and the depth of the tissue simulating liquid was 15.1 cm.
