Test System Verification Scans

The SAR result indicated on the Manufacture's Calibrated certificate for dipoles D2450V2 S/N 704 and D5GHzV2 S/N 1017 are not used due to the following:

- The IEEE1528-2003 and the FCC OET-65 Supplement C, System Verification section recommends that the measured 1-g SAR should be within 10% of the expected target values specified for the specific phantom and RF source used in the system verification measurement.
- SPEAG calibration certificate indicates that the allowed tolerance for the dipole is higher than +/- 10% (e.g. 53.4 +/- 17.0% at k=2 for the D2450V2 S/N 704 and 77.3 +/-17.0%, 83.2 +/-17.0%, 77.2 +/-17.0% at k=2 for the D5GHzV2 S/N 1017 at 5200MHz, 5500MHz and 5800MHz for the 1g-SAR).
- The allowed tolerances for the probes are also higher than +/- 10% (e.g. 12% at k=2 at 2450MHz and 13.1%, at k=2 at 5200MHz, 5500MHz and 5800MHz for the probes being used to assess this product).

Due to probe, dipole and system tolerances noted above, the lab averages dipole results across multiple probes to establish a set of averaged targets for each dipole using the following procedure:

- The System Validation was conducted per IEEE1528-2003 and IEC62209-2 Edition 1.0 2010-03 standards using the simulated head tissue and multiple probes that are available and applicable for the dipole under test to verify the System Validation. Results for this dipole are within the measurement system uncertainty of the reference SAR values indicated within IEC62209-2 Edition 1.0 2010-03 when using flat phantom with 2mm thickness is used. These results then are averaged and used as the target for the daily system performance check when the simulated head tissue is used.
- The dipole targets for the body are set immediately following the same process noted above. Since there is no standard referencing the SAR values for the System Validation using the simulated body tissue, the compliant System Validation results using the simulated head tissue are used to justify the use of the System Validation results using the simulated body tissue due to the same setup except for the simulated tissue type.

The targets set in this report were conducted following the above process.

Note that the target set for the tested dipoles, when using the simulated head tissue, meets the requirement for the system validation per IEEE1528-2003, IEC62209-2 Edition 1.0 2010-03 standards, and the differences between this result and the result from the manufacture's dipole calibration certificates are 3.6% for D2450V2 S/N 704 dipole and 5.2% at 5200MHz, 5.8% at 5500MHz and 6.7% at 5800MHz for D5GHzV2 S/N 1017 dipole which are well within the measurement uncertainty of the measurement system at k=2.

To assess the isotropic characteristics of the measurement probe, a probe rotation was performed using the "Rotation (1D)" function in the DASY software with a measured isotropy tolerance of +/- 0.5dB.
