## 1.0 Introduction

This report contains calculated Maximum Permissible Exposure (MPE) results for product VML750 model F0025A (FLN1057A). This product (Baseline) contains module FCC ID: N7NMC7355 (Module).

## 2.0 FCC MPE Summary

**Table 1**

| Equipment Class      | Frequency band (MHz)                                       | Max. Power Density (with respect to MPE limits)* (mW/cm <sup>2</sup> ) | % of FCC MPE Limit |

\* Although there may be higher power density levels reported in the data tables, these are the highest with respect to the applicable FCC limit at the test frequency and are therefore reported here.

## 3.0 Abbreviations / Definitions

BPSK: Binary Phase-Shift Keying  
 CCK: Complementary Code Keying  
 CDMA: Code Division Multiple Access  
 DBPSK: Differential Binary Phase-Shift Keying  
 DQPSK: Differential Quadrature Phase-Shift Keying  
 DTS: Digital Transmission System  
 DUT: Device Under Test  
 EME: Electromagnetic Energy  
 EVDO: Evolution-Data Optimized  
 GPS: Global Positioning System  
 LTE: Long Term Evolution  
 MPE: Maximum Permissible Exposure  
 OFDM: Orthogonal Frequency-Division Multiplexing  
 QAM: Quadrature Amplitude Modulation  
 QPSK: Quadrature Phase-Shift Keying  
 PCB: PCS Licensed Transmitter  
 TNB: Licensed Non-Broadcast Station Transmitter  
 WLAN: Wireless Local Area Network  
 WiFi: Wireless Fidelity

#### 4.0 Referenced Standards and Guidelines

This product is designed to comply with the following applicable national and international standards and guidelines.

- Federal Communications Commission, “Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields”, OET Bulletin 65, FCC, Washington, D.C.: 1997
- American National Standards Institute (ANSI) / Institute of Electrical and Electronics Engineers (IEEE) C95. 1-1999
- American National Standards Institute (ANSI) / Institute of Electrical and Electronics Engineers (IEEE) C95. 1-1992. Specific to FCC rules and regulations.
- Institute of Electrical and Electronics Engineers (IEEE) C95.3-2002

#### 5.0 Power Density Limits

**Table 2 – Occupational / Controlled Exposure Limits**

| Frequency Range (MHz) | FCC OET Bulletin 65 | IEEE C95.1 1992/1999 | IEEE C95.1 2005  |
|-----------------------|---------------------|----------------------|------------------|
|                       | mW/cm <sup>2</sup>  | mW/cm <sup>2</sup>   | W/m <sup>2</sup> |
|                       |                     |                      |                  |
| 30 – 300              | 1.0                 |                      |                  |
| 10 – 400              |                     |                      |                  |
| 100 – 300             |                     | 1.0                  | 10.0             |
| 300 – 1,500           | f/300               |                      |                  |
| 300 – 3,000           |                     | f/300                | f/30             |
| 400 – 2,000           |                     |                      |                  |
| 1,500 – 15,000        |                     |                      |                  |
| 1,500 – 100,000       | 5.0                 |                      |                  |
| 2,000 – 300,000       |                     |                      |                  |
| 3,000 – 300,000       |                     | 10.0                 | 100.0            |

**Table 3 – General Population / Uncontrolled Exposure Limits**

| Frequency Range (MHz) | FCC OET Bulletin 65 | IEEE C95.1 1992/1999 | IEEE C95.1 2005  |
|-----------------------|---------------------|----------------------|------------------|
|                       | mW/cm <sup>2</sup>  | mW/cm <sup>2</sup>   | W/m <sup>2</sup> |
|                       |                     |                      |                  |

## 6.0 Product and System Description

VML750 Model F0025A (FLN1057A) is a data modem for vehicular applications. The modem supports LTE Bands 2 / 4 / 5 / 13 / 14 / 17 and 25 (1850 – 1910 / 1710 – 1755 / 824 – 849 / 777-787 / 788-798 / 704 – 716 / 1850 – 1910 MHz), 3G Bands 2 and 5 (1850 – 1910 / 824 – 849 MHz), EVDO Bands 0 and 1 (824 – 829 / 1850 – 1910 MHz) and WiFi (2401-2473MHz). The maximum duty cycles are 100% for LTE / 3G / EVDO and WiFi. Simultaneous transmission is possible between WiFi and one of the other TX bands at any given time.

This device is capable of operating in the TX frequency range(s), duty cycle(s), maximum output power(s) and antenna gain(s) presented in Table 4 section 7.0 MPE Assessment.

## 7.0 Assessment Method

MPE calculations were used to determine the RF exposure for this device. According to FCC's OET Bulletin 65 Edition 97-01 Section 2, calculations can be made to predict RF field strength and power density levels around typical RF sources. For example, in the case of a single radiating antenna, a prediction for power density in the far-field of the antenna can be made by use of the general Equations (1) or (2) below. These equations are generally accurate in the far-field of an antenna but will over-predict power density in the near field, where they could be used for making a "worst case" or conservative prediction. Equation 2 was used to show compliance for this device.

Equation 1

$$S = \frac{PG}{4\pi R^2} = \frac{EIRP}{4\pi R^2}$$

Where: S = power density (mW/cm<sup>2</sup>)  
P = power input to the antenna (mW)  
G = power gain of the antenna in the direction of interest relative to an isotropic radiator (dBi)  
R = distance to center of radiation of the antenna (cm)  
EIRP = equivalent (or effective) isotropically radiated power

Or Equation 2

$$S = \frac{P_t G}{4\pi d^2 L} F$$

Equation (2) accounts for the maximum duty cycle of the signal, and the factor, F, to provide a worst-case prediction of power density per FCC OET Bulletin 65, Edition 97-01 1997.

Where: S = power density (mW/cm<sup>2</sup>)  
P<sub>t</sub> = maximum output power scaled by the maximum duty cycle of the signal  
G = power gain of the antenna in the direction of interest relative to an isotropic radiator (dBi)  
d = distance from antenna (cm)  
L = cable loss (dB) (0 dB used as worst case for analysis)  
F = 1.0

## 8.0 MPE Assessment

**Table 4**  
**MPE calculation Results**

| Antenna #       | Max Power (W) | Duty Cycle (%) | Tx Frequency (MHz) | Antenna Gain (dBi) | Cable Loss, L (dB) | Dist., d (cm) | <sup>(4)</sup> Enhance Factor, F | Max Calc. MPE (mW/cm <sup>2</sup> ) | % Result of FCC Spec Limit | MPE Spec Limit (mW/cm <sup>2</sup> ) |
|-----------------|---------------|----------------|--------------------|--------------------|--------------------|---------------|----------------------------------|-------------------------------------|----------------------------|--------------------------------------|

## 9.0 Conclusion

The MPE results per the assessment in section 8.0 are compliant to the FCC General population/Uncontrolled RF exposure limits per FCC OET Bulletin 65.
