A. Part 90 Subpart I

1. 90.207 (a) (1) Types of Emissions (Device Classification)

Classified as an **F3E** emitter (Frequency Modulation, Analog Modulation, Voice). Power level: 250 mW. The Emission Designator becomes **F3E 15K0**

2. 90.209 (a) (5) Bandwidth Limitations (Device Classification, Test Condition).

3. Part 2.985 Output Power, Part 2.991 Spurious Emissions at Antenna terminals and Part 2.989 Occupied bandwidth using 90.210 (d) Emission Mask for F3E Transmitter.

a) Test Requirement:

(1) On any frequency from the center of the authorized bandwidth f_o to 5.625 kHz removed from f_o : Zero dB.

(2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least $7.27(f_d - 2.88 \text{ kHz})$ dB.

(3) On any frequency removed from the center of the authorized band by a displacement frequency (f_d in kHz) of more than 12.5 kHz : At least $50 + 10 \log (P)$ dB or 70 dB, whichever is the lesser attenuation.

The test condition is presented in Tabular form below. The definition of the spectrum mask as indicated on the spectrum analyzer is also presented, where the display line set to -20 dBm applies to $|f_m| > 12.5 \text{ kHz}$.

5. 90.214: Transient Frequency Behavior.

a) Test Requirement

Transmitters designed to operate within the 150 to 174 MHz bands must maintain transient frequencies within the maximum frequency difference during the time intervals indicated in the table below. This device is designed to operate on 12.5 kHz channel bandwidth. The output power of the device is less than 6 Watts, therefore the transient frequency can exceed the limit for the time intervals t_{on} to t_1 and t_{off} to t_3 .

The time, t_{on} , is defined when the transmitter power exceeds -13 dBm at the transmitter output. The modulation domain analyzer is triggered on the envelope of the RF power and the zero time indication is reference to this trigger level. The time, t_{off} , is defined when the transmitter is turned off and the power level falls below -13 dBm.

Time Interval	Transient Frequency Limit	Settling Time
t_1	± 12.5 kHz	5.0 ms
t_2	± 6.25 kHz	25.0 ms
t_3	± 12.5 kHz	5.0 ms

V. Uncertainty Analysis

HP Spectrum Analyzer Total Uncertainty (-60 dBm level):

Perform Root-Sum-Square of three uncertainties to find total uncertainty for a 95% confidence level:

Uniform uncertainties specify the probability density interval $\pm a$. The variance of the uniform density is $a^2/3$.

Sum the uncorrelated variances to find the total variance:

$$\text{Total variance} = [(0.3 \text{ dB} + 0.01 \cdot 40 \text{ dB})/3 + (0.4)/3 + (0.15)/3] = 1.25/3 = 0.416$$

The uncertainty for a 95% confidence interval is 1.96 times the standard deviation:

$$\text{Total Uncertainty} = \pm 1.96 \cdot \sqrt{0.416} = 1.96 \cdot 0.644 = \pm 1.26 \text{ dB}$$
