FCC COMPLIANCE TEST REPORT
ON
X-10 (USA), INC.
310MHz SUPERREGENERATIVE
RECEIVER
Model: CM14A
FCC ID: B4SCM14A

CUSTOMER NAME: X-10 (USA) Inc.

CUSTOMER P.O.: Verbal Authorization

DATE OF REPORT: April 16, 1998

RETLIF TEST REPORT NO.: R-7480-1

TEST START DATE: March 24, 1998

TEST FINISH DATE: March 25, 1998

TEST TECHNICIAN: D. Cortes

TEST ENGINEER: T.J. Schneider

REPORT WRITTEN BY: L. Anderson

SUPERVISOR: R.J. Reitz

GOVERNMENT SOURCE INSPECTION: Not Applicable

Our letters and reports are for the exclusive use of the customer to whom they are addressed, and their communication to any other or the use of the name of RETLIF TESTING LABORATORIES must receive our prior written approval. Our letters and reports apply only to the sample tested and are not necessarily indicative of the qualities of apparently identical or similar products. The reports and letters and the name of RETLIF TESTING LABORATORIES or insignia are not to be used under any circumstances in advertising to the general public. This test report shall not be reproduced, except in full, without the written approval of RETLIF TESTING LABORATORIES.

CERTIFICATION AND SIGNATURES

We certify that this report is a true report of the results obtained from the tests of the equipment stated. We further certify that the measurements shown in this report were made in accordance with the procedures indicated and vouch for the qualifications of all Retlif Testing Laboratories personnel taking them.

Thomas J. Schneider
EMC Test Engineer
NVLAP Approved Signatory

Richard J. Reitz
Laboratory Manager
NVLAP Approved Signatory

NON-WARRANTY PROVISION

The testing services have been performed, findings obtained, and reports prepared in accordance with generally accepted testing laboratory principles and practices. This warranty is in lieu of all other warranties, either express or implied.

NON-ENDORSEMENT

This test report contains only findings and results arrived at after employing the specific test procedures and standards listed herein. It is not intended to constitute a recommendation, endorsement, or certification of the product or material tested. This test report may not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government.

TEST SPECIFICATION: Part 15, Subpart B Certification

TEST PROCEDURE: ANSI C63.4:1992

TEST SAMPLE DESCRIPTION

BRANDNAME: X-10 Activehome MODEL: CM14A

TYPE: 310MHz Superregenerative Receiver

POWER REQUIREMENTS: 115VAC, 60Hz, 1ø

OPERATING FREQUENCY: 310MHz

TESTS PERFORMED

Para. 15.107(a), Conducted Emissions

Para. 15.109(a), Radiated Emissions

I HEREBY CERTIFY THAT: The measurements shown here were in accordance with the procedure indicated and that the energy emitted by this equipment was found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements and vouch for the qualifications of all persons taking them.
I FURTHER CERTIFY THAT: On the basis of the measurements made, the device tested is capable of operation in compliance with the requirements of Part 15 of the FCC Rules under normal use and maintenance.

Test Procedures Used

The test procedures used for all testing follow the guidelines specified in the applicable FCC specification and general industry practices. Although test procedures may sometimes have to be modified to address the needs of specific test samples, the following forms the basis for all testing programs:

Conducted Emissions - All testing was performed with the test sample placed 80cm above a 2.5 x 3M ground plane and 1 meter from any other grounded surface. The power cord of the test sample was connected to the Line Impedance Stabilization Networks, which in turn, had their cases mounted to the ground plane. With the equipment connected as stated, an EMI meter or spectrum analyzer was connected to the LISN and the conducted emissions were measured over the frequency range of 450KHz to 30MHz, in turn on each of the input power leads. Care was taken during testing to relocate all system components and cabling in an effort to maximize the emissions from the EUT.

Radiated Emissions - Radiated emissions testing was performed on an FCC listed 3 meter open field test site over the frequency range of 30MHz to 2000MHz. Prior to open field testing, pre-scan testing was performed inside of a shielded enclosure in order to obtain a spectrum signature of the unit and to use the data obtained as a guideline for open field testing. When the test sample is taken to the open field tests site, it is placed on an 80cm high wooden turntable. A spectrum analyzer or EMI meter is then connected to the biconilog antenna, depending on frequency range being scanned. The antenna is mounted on a remote controlled four meter antenna mast. The frequency range was then scanned and each measurement taken was maximized by performing the following: (1) Raising and lowering the measurement antenna. (2) Rotating the measurement antenna to both the horizontal and vertical polarizations. (3) Tuning the measurement antenna to the frequency of measurement. (4) Rotating the test sample, and (5) Relocating all interconnecting and input power cables. In the event that testing was extended above or below the frequency range of 30MHz to 1000MHz, loop antennas were used for all measurements below 30MHz and horn antennas were used for all measurements above 1000MHz.
