GE Security, Inc.

1. Introduction

This device is a radio transceiver. It receives signals from existing ITI transmitters or other transceivers. It transmits signals to other super board transceivers. A hardwire bus provides a data link to an external board or a security panel.

12VDC power is supplied to the device via either a hardwire bus connection or a Class 2 transformer.

The transceiver board has a profile, which is 4.75" long by 3.25" wide.

We are requesting Certification under FCC Rules, Part 15, Subpart C, Paragraph 15.231.

Please send comments/suggestions on the report format to john.bergman@ge.com.

Grantee Code: B4Z

2. Statement of Compliance

§2.907

Certification

This is an application for certification

§2.911

Application

- a) This is an application and has been filed electronically with form 731.
- b) All information required has been supplied.
- c) The applicant has signed the application (electronically).
- d) The technical data has been signed.
(See Radiated Emissions)
- e) Applicant signature block on electronic form 731 completed by officer of the company or authorized company personnel.
- f) The appropriate fee has been paid electronically with VISA on
//**.

§2.915

Grant

This application demonstrates that all applicable technical standards have been met and a grant of this application will serve the public interest.

FCC_REPT.DOC 08/06/04 10:32 AM	FCC ID: B4Z-875-TCVR	Page 4 of 19
-----------------------------------	----------------------	--------------

GE Security, Inc.

§2.925 Label

Each piece of equipment for which authorization will be granted will be uniquely identified with "FCC ID: B4Z-875-TCVR." The required statement will appear with the FCC ID on the product and, although not required, in the installation instructions. See Exhibit A, PDF file *id_label.pdf*

§2.947 Measurement Procedure

- a) The measurement procedure follows ANSI C63.4 procedure. Procedural notes are contained in the laboratory report.
- d) A list of test equipment used is contained in the laboratory report.

§2.948 Description of Measurement Facilities

Measurements were performed at TUV Testing Services Open Test Site. The FCC keeps a full description of the measurement facilities on file. TUV's acceptance and approval is dated as December 5, 1993 in a letter received from the FCC.

The address of the test facility is:

TUV Product Service
19035 Wild Mountain Road
Taylors Falls, MN 55084-1758

Phone: 651-638-0297
Contact: Joel Schneider
Test Engineer in Charge

See Exhibit F, PDF file *test_pho.pdf* for sketch of measurement setup

§2.1033 Application for Certification

- a) Form 731 has been electronically filed on **/**/**. Items that did not apply were left blank.
- b) This technical report contains the following information where applicable.
 - 1) Full name and mailing address of manufacturer and applicant for certification:
GE Security, Inc.
1275 Red Fox Road
Arden Hills, MN 55112
 - 2) FCC Identifier: **B4Z-875-TCVR**

FCC_REPT.DOC 08/06/04 10:32 AM	FCC ID: B4Z-875-TCVR	Page 5 of 19
-----------------------------------	----------------------	--------------

GE Security, Inc.

- 3) Copy of installation instructions:
See Exhibit G, PDF file: *user_man.pdf*
 - 4) Brief Description of circuit functions and device operation:
See Exhibit I, PDF file *op_desc.pdf*
See Exhibit D, PDF file *schemat.pdf* for schematics (page 1) and parts placement (page 2) diagrams.
 - 5) Block Diagram
See Exhibit C, PDF file *block.pdf*.
 - 6) Report of the measurements of radiation and conducted emissions:
See Exhibit E, PDF file *emissions_tuv.pdf*
 - 7) Photographs
External:
See Exhibit B, PDF file *extern.pdf*
Internal:
See Exhibit H, PDF file *intern.pdf*
 - 8) Peripheral or Accessory devices:
This device is designed to interface via hardwired bus to an external board or security panel. There are three external ports for the connection of these devices. See Exhibit I, "*op_desc.pdf*" for more information. The testing for this report was performed with a representative device connected to each of the external ports.
Operational Description
See Exhibit I, PDF file *op_desc.pdf*
AC line emissions with daughter board

 - 9) Transition Rules
This application is not pursuant to the transition rules of §15.37
 - 10) Emergency Broadcast decoding:
This is not applicable to device in this application.
 - 11) Application for direct sequence spread spectrum devices...
This is not applicable to device in this application.
 - 12) Application for scanning receivers...
This is not applicable to device in this application.
- c) Composite Systems
This is not applicable to device in this application.

3. Lab Measurements Discussion / Test Notes

3.1 Test Notes

3.1.1 Transmissions shall cease within 5 seconds of activation [§15.231(a)(2)]

Transmissions consist of 1 packet, which is controlled by a security panel or daughter board connected to the super board transceiver. The packet duration is at most 30 mS, see **Duty Cycle Correction Factor** [§15.231(b)(2) and §15.35(c)].

Transmission duration = 30mS

The following plot shows a packet transmission that concludes in less than 5 seconds.

3.1.2 Duty Cycle Correction Factor [§15.231(b)(2) and §15.35(c)]

The transmitter employs amplitude modulation and transmits 61 bit or 80 bit ITI protocol. The duty cycle correction factor will be derived for both 61 bit and 80 bit ITI protocol.

A 61 bit ITI protocol packet begins with an “ON” time of 854 μ S, each bit has an “ON” time of 122 μ S, and one bit has an additional 244 μ S. The total “ON” time of a single packet is:

$$854 \mu\text{S} + 61 * 122 \mu\text{S} + 244 \mu\text{S} = 8.54 \text{ mS}.$$

Only one packet is sent in any given 100 mS window for a duty cycle correction factor of:

$$20*\text{LOG}(8.54/100) = -21.4 \text{ dB}$$

In 80 bit ITI protocol packet each bit has an “ON” time of 122 μ S. The total “ON” time of a single packet is:

$$80 * 122 \mu\text{S} = 9.76 \text{ mS}.$$

Only one packet is sent in any given 100 mS window for a duty cycle correction factor of:

$$20*\text{LOG}(9.76/100) = -20.2 \text{ dB}$$

The maximum allowed correction factor is -20.0 dB.

The following plots show:

1. Single packet in 100 mS window.
2. Expanded view of a packet with a duration of 26 mS

GE Security, Inc.

3.1.3 Bandwidth Measurement [§15.231(c)]

Bandwidth Measurements were made in peak mode, using a Hewlett Packard Spectrum Analyzer, model number 70000.

The spectrum analyzer 20 dB skirt bandwidth is 1.8 KHz.

The allowed 20 dB bandwidth is 0.25% of center frequency.

Estimated signal bandwidth = Measured signal bandwidth - analyzer bandwidth.

Center Frequency MHz	Measured 20 dB Bandwidth in KHz	Estimated 20 dB signal Bandwidth in KHz	FCC allowed 20 dB Bandwidth in KHz
319.508	42.5	40.7	799

The following three plots show:

1. Bandwidth of carrier without modulation
2. Bandwidth of signal with modulation, 200 KHz span
3. Bandwidth of signal with modulation, 200 MHz span

GE Security, Inc.

3.1.4 Emissions Measurements

3.1.4.1 Radiated Emissions Summary

The super board transceiver passes FCC Rules Part 15, Subpart C, Paragraph 15.231. The highest fundamental radiated emission was 0.7 dB below the FCC limit at 319.5 MHz. The highest spurious emission measurement was 20.75 dB below the FCC limit at 639 MHz. This highest forbidden band spur was 24.21 dB below the FCC limit at 1598 MHz.

3.1.4.2 FCC Emissions Calculation

3.1.4.2.1 Terms

Term	Abbreviation	Units	Description
Analyzer Reading	AR	dB μ V	The power reading read directly from the analyzer without any correction for cabling or receive antenna.
Duty Cycle Correction	DC	dB	Correction for averaging measurement, see Duty Cycle Correction Factor [§15.231(b)(2) and §15.35(c)]
Antenna Factor	AF	dB	Calibration factor for measurement antenna which converts from dB μ V measured with antenna to the field strength received by the antenna in dB μ V/M.
Cable Loss	CL	dB	Amount of power lost in cable (and connectors, if any) between antenna and analyzer
Pre-Amp	PA	dB	Gain in pre-amp
Attenuator Loss	AL	dB	Attenuator factor which corrects for the fundamental attenuator which prevents the Pre-Amp from creating harmonics from the fundamental.

GE Security, Inc.

3.1.4.2.2 Example Calculation

AR = 99.3 dBμV

AF = 13.9 dB

CL = 3.8 dB

DC = 20 dB

PA=26.2 dB

AL=0.3 dB

The field strength for comparison to FCC limits is found to be:

$$AR + AF + CL - DC - PA + AL = 99.3 + 13.9 + 3.8 - 20 - 26.2 + 0.3 = 71.1 \text{ dB}\mu\text{V/M}$$

Alternatively, the AR + AF + CL - PA is compared to the FCC limit + DC. This number is often written to the right of measurement data on the test results. For example, the FCC limit for ITI transmitters at 319.5 MHz is approximately 95.9 dBμV/M. The limit from §15.231(b) with linear interpolation yields a limit, without consideration for duty cycle, of approximately 75.9 dBμV/M.

To convert to μV/M the following equation is used:

$$\mu\text{V/M} = \text{INVLOG}(\text{dB}\mu\text{V/M} / 20)$$

For the above example, 71.1 dBμV/M is 3,589.219μV/M

3.1.4.3 Radiated Emissions

The highest fundamental emission along with the three highest spurious and restricted band emissions are listed below as per ANSI C63.4 paragraph 10.1.8.2. Emissions from 0.009 MHz to the tenth harmonic were measured as per FCC Rules Part 15, Subpart C, Paragraph 15.33(a). Emission limits were derived from §15.231(b).

Frequency	Analyzer Reading	Duty Cycle Correction	Cable Loss	Antenna Factor	Pre-Amp	Attenuator Loss	Field Strength	Field Strength	FCC Limit
MHz	dBuV	dB	dB	dB	dB	dB	dBuV/M	uV/M	uV/M
319.5	79.6	20	1.5	14.1	0	0	75.2	5,754	6,229
639	59.3	20	2.1	20	27.05	0.8	35.15	57	1,250
1917	40.8	20	3.88	29.12	26.76	0.75	27.79	25	500
2876	43.55	20	4.63	31.45	26.26	0.3	33.67	48	1,250
3196	39.8	20	4.94	32.21	26.59	0.4	30.76	35	500

GE Security, Inc.

3.1.4.4 *Forbidden Bands*

Noise floor of spectrum analyzer with antenna factors and duty cycle correction converted to $\mu\text{V/M}$ at approximately one meter.

All measurements were taken with an HP 8566B Spectrum Analyzer. The bandwidth was 100 KHz for measurements below 1000 MHz. The bandwidth was 1 MHz for measurements above 1000 MHz. The video filter was off.

The noise floor measurements are summarized in the table below. See also the test data included in this report.

3.1.5 Public Utility Power Line Measurements [§15.207]

The voltage conducted back onto the AC power line was measured for all three system configurations and found to be in compliance with the Class B limits. Please see Exhibit L, “*ac_concord.pdf*”, Exhibit K, “*ac_networkx.pdf*”, and Exhibit J, “*ac_daughter.pdf*”.
