Note(s):

1. The measurement was performed to assist in the calculation of the level of average output power, power spectral density and emissions as the EUT employs pulsed operation.
2. Frequency stability is better than 20 ppm which ensures that the signal remains in the allocated bands under all operational conditions stated in the user manual.
3. Transmit Power Control was not tested as the maximum EIRP is less than 500 mW (27 dBm).
4. There are two vendors of the WiFi/Bluetooth radio modules, Vendor 1 and Vendor 2.
5. The WiFi/Bluetooth radio modules have the same mechanical outline (e.g. the same packaging dimension and pin layout), use the same on-board antenna matching circuit, have an identical antenna structure and are built and tested to conform to the same specification and to operate within the same tolerances.
Baseline testing was performed on the two vendors to determine the worst case.

4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Continuously transmitting with a modulated carrier at maximum power on the bottom, middle and top channels as required using the supported data rates/modulation types.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- For radiated measurements: Controlled using a bespoke application on the laptop PC supplied by the customer. The application was used to enable a continuous transmission mode and to select the test channels, data rates and modulation schemes as required.
- For conducted measurements: Controlled using software *RePlay v.2.6.0.7* on a laptop PC. The application was used to enable a continuous transmission mode and to select the test channels, data rates and modulation schemes as required. The customer supplied documents with test instructions, titled *Power_Tables_for_conducted_testing_v9* and *FCC_BE_Commands_v9*.
- The customer declared the following data rates to be used for all measurements as:
 - 802.11a – BPSK / 6 Mbps / Port 1
 - 802.11n HT20 SISO – BPSK / 6.5 Mbps / MCS0 / Port 1
 - 802.11n HT40 SISO – BPSK / 13.5 Mbps / MCS0 / Port 1
 - 802.11ac VHT80 SISO – BPSK / 29.3 Mbps / MCS0 / Port 1
 - 802.11n HT20 MIMO – BPSK / 6.5 Mbps / MCS0
 - 802.11n HT40 MIMO – BPSK / 13.5 Mbps / MCS0
 - 802.11ac VHT80 MIMO – BPSK / 29.3 Mbps / MCS0x1
- The EUT has two separate antennas which correspond to two separate antenna ports. Port 1 and Port 2 correspond to antenna 1 (UAT) and antenna 2 (LAT) respectively.
- RF cables and attenuators connecting the test equipment to the EUT were calibrated before use and the calibration data incorporated into the conducted measurement results.
- The EUT was placed in three orthogonal orientations X, Y and Z to determine the worst case orientation for radiated spurious emissions. The worst case orientation was X.
- Transmitter spurious emissions were performed with the EUT transmitting with a data rate of MCS0 / MIMO (802.11n HT20). This was found to be the worst case modulation scheme with regards to emissions after preliminary investigations and, as this mode emits the highest transmit output power level, it was deemed to be the worst case.
- Transmitter radiated spurious emissions tests were performed with the PHF connected to the EUT.
- The worst-case radiated emission among all accessories is determined by the manufacturer to be with the headset connected. The compliance lab performed final testing only with the headset.

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6 Measurement Uncertainty* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2. Test Results

5.2.1. Transmitter 26 dB Emission Bandwidth

Test Method Used:	KDB 789033 D02 Section II.C.1.

Environmental Conditions:

Temperature (°C):	24
Relative Humidity (%):	45

Note(s):

1. The customer declared the following data rates to be used for all measurements as:
 - 802.11a – BPSK / 6 Mbps / Port 1
 - 802.11n HT20 SISO – BPSK / 6.5 Mbps / MCS0 / Port 1
 - 802.11n HT40 SISO – BPSK / 13.5 Mbps / MCS0 / Port 1
 - 802.11ac VHT80 SISO – BPSK / 29.3 Mbps / MCS0 / Port 1
 - 802.11n HT20 MIMO – BPSK / 6.5 Mbps / MCS0
 - 802.11n HT40 MIMO – BPSK / 13.5 Mbps / MCS0
 - 802.11ac VHT80 MIMO – BPSK / 29.3 Mbps / MCS0x1
2. The signal analyser's resolution bandwidth was set to 1 – 5% of the measured 26 dB emission bandwidth.
3. Final measurements were performed in each supported operating band using the above configurations on the relevant channels.
4. The signal analyser was connected to the RF port on the EUT using an RF switch, suitable attenuation and RF cables. An RF level offset was entered on the signal analyser to compensate for the loss of the switch, attenuators and RF cables.
