4. Operation and Monitoring of the EUT during Testing

4.1. Operating Modes

The EUT was tested in the following operating mode(s):

- Continuously transmitting with a modulated carrier at maximum power on the bottom, middle and top channels as required using the supported data rates/modulation types.

4.2. Configuration and Peripherals

The EUT was tested in the following configuration(s):

- Controlled using a bespoke application on the laptop PC supplied by the customer. The application was used to enable a continuous transmission mode and to select the test channels, data rates and modulation schemes as required.
- The customer declared the following data rates to be used for all measurements as:
 - o 802.11b – DBPSK / 1 Mbps
 - o 802.11g – BPSK / 6 Mbps
 - o 802.11n HT20 SISO – BPSK / 6.5 Mbps / MCS0
 - o 802.11n HT20 MIMO – BPSK / 6.5 Mbps / MCS0
- The EUT has two separate antennas which correspond to two separate antenna ports. Port 1 and Port 2 correspond to antenna 1 and antenna 2 respectively.
- For 802.11b and 802.11g the EUT transmits only from antenna 1, therefore conducted measurements were performed on Port 1 only.
- For 802.11n the EUT can transmit from both antennas, therefore conducted measurements were performed on both ports.
- Transmitter spurious emissions and AC conducted emissions tests were performed with the EUT transmitting with a data rate of 6.5 Mbps / MCS0 / MIMO. This was found to be the worst case modulation scheme with regards to emissions after preliminary investigations and, as this mode emits the highest output power level, it was deemed to be the worst case.
- Transmitter radiated spurious emissions and AC conducted emissions tests were performed with the AC Charger, USB cable and PHF connected to the EUT as this was found to be the worst case during pre-scans. All the accessories were individually connected and measurements made during the pre-scans to determine the worst case combination.
- The conducted sample with IMEI 352025060005387 was used for minimum 6 dB bandwidth, duty cycle, maximum output power and power spectral density tests.
- The radiated sample with IMEI 352025060307270 was used for all other tests.

4.3. Worst case Justification

5. Measurements, Examinations and Derived Results

5.1. General Comments

Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to *Section 6. Measurement Uncertainty* for details.

In accordance with UKAS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

5.2.3. Transmitter Duty Cycle**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Date:	30 July 2014
Test Sample IMEI:	352025060005387		

FCC Reference:	Part 15.35(c)
Test Method Used:	As detailed in FCC KDB 558074 Section 6.0

Environmental Conditions:

Temperature (°C):	25
Relative Humidity (%):	40

Note(s):

1. In order to assist with the determination of the average level of fundamental and spurious emissions field strength, measurements were made of duty cycle to determine the transmission duration and the silent period time of the transmitter. The transmitter duty cycle was measured using a spectrum analyser in the time domain and calculated by using the following calculation:

$$10 \log (1 / (\text{On Time} / [\text{Period or } 100 \text{ ms whichever is the lesser}])).$$

$$802.11g / 20 \text{ MHz} / 6 \text{ Mbps duty cycle } 10 \log (1 / (2.050/2.104)) = 0.1 \text{ dB}$$

$$802.11n / HT20 / MCS0 / SISO / \text{Port 1 duty cycle: } 10 \log (1 / (1.904/1.949)) = 0.1 \text{ dB}$$

$$802.11n / HT20 / MCS0 / SISO / \text{Port 2 duty cycle: } 10 \log (1 / (1.900/1.945)) = 0.1 \text{ dB}$$

$$802.11n / HT20 / MCS0 / MIMO / \text{Port 1 duty cycle: } 10 \log (1 / (1.895/1.940)) = 0.1 \text{ dB}$$

$$802.11n / HT20 / MCS0 / MIMO / \text{Port 2 duty cycle: } 10 \log (1 / (1.882/1.949)) = 0.2 \text{ dB}$$

2. For 802.11b, the duty cycle was measured to be greater than 98%.

3. For 802.11b and 802.11g the EUT transmits only from antenna 1, therefore conducted measurements were performed on port 1. For 802.11n the EUT can transmit from both antennas, therefore conducted measurements were performed on both ports.
4. For 802.11b, the EUT was transmitting at 100% duty cycle and testing was performed in accordance with KDB 558074 Section 10.3 measurement procedure Method AVGPS-1.
5. For 802.11g and 802.11n, the EUT was transmitting at <98% duty cycle and testing was performed in accordance with KDB 558074 Section 10.5 measurement procedure Method AVGPS-2. The calculated duty cycle in section 5.2.3 was added to the measured average power spectral density in order to compute the average power spectral density during the actual transmission time.
6. For 802.11n MIMO, PSD was measured on both ports and then combined using the *measure and sum spectral maxima across the outputs* technique, stated in FCC KDB 662911 D01 Section E)2)b).
7. The signal analyser was connected to the RF port on the EUT using suitable attenuation and RF cable. An RF level offset was entered on the signal analyser to compensate for the loss of the attenuator and RF cable.

5.2.5. Transmitter Maximum (Average) Output Power**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Date:	22 July 2014
Test Sample IMEI:	352025060005387		

FCC Reference:	Part 15.247(b)(3)
Test Method Used:	As detailed in FCC KDB 558074 Sections 9.2.2.2 & 9.2.2.4

Environmental Conditions:

Temperature (°C):	26
Relative Humidity (%):	36

Transmitter Maximum (Average) Output Power (continued)**Note(s):**

1. The customer declared the following data rates to be used for all measurements as:
 - o 802.11b – DBPSK / 1 Mbps
 - o 802.11g – DBPSK / 6 Mbps
 - o 802.11n SISO / HT20 – BPSK / 6.5 Mbps / MCS0 (GI = 800 ns)
 - o 802.11n MIMO / HT20 – BPSK / 6.5 Mbps / MCS0 (GI = 800 ns)
2. Final measurements were performed using the above configurations on the bottom, middle and top channels. The power has been integrated over the 99% occupied bandwidth. Plots for the occupied bandwidth are archived on the company server and available for inspection upon request.
3. For 802.11b and 802.11g the EUT transmits only from antenna 1, therefore conducted measurements were performed on port 1. For 802.11n the EUT can transmit from both antennas, therefore conducted measurements were performed on both ports.
4. For 802.11b, the EUT was transmitting at 100% duty cycle and testing was performed in accordance with KDB 558074 Section 9.2.2.2 measurement procedure AVGSA-1.
5. For 802.11g and 802.11n, the EUT was transmitting at <98% duty cycle and testing was performed in accordance with KDB 558074 Section 9.2.2.4 measurement procedure AVGSA-2. The calculated duty cycle in section 5.2.3 was added to the measured power in order to compute the average power during the actual transmission time.
6. For 802.11n MIMO, power was measured on both ports and then combined using the measure-and-sum technique stated in FCC KDB 662911 D01 Section E1).
7. As the data streams are correlated for 802.11n MIMO, the directional antenna gain has been calculated in accordance with Section F2)e(ii):

$$\text{Directional Gain} = 10 \log \left[\frac{\sum_{j=1}^{N_{SS}} \left(\sum_{k=1}^{N_{ANT}} g_{j,k} \right)^2}{N_{ANT}} \right]$$

$$\text{For } N_{SS} = 1, N_{ANT} = 2, g_{1,1} = 10^{\frac{G_{ANTENNA 1}}{20}} = 10^{\frac{0.8}{20}} \text{ and } g_{1,2} = 10^{\frac{G_{ANTENNA 2}}{20}} = 10^{\frac{-1.9}{20}},$$

the equation above gives the following result:

$$\text{Directional Gain} = 10 \log \left[\frac{\left(10^{\frac{0.8}{20}} + 10^{\frac{-1.9}{20}} \right)^2}{2} \right] = 2.6 \text{ dBi}$$

8. The signal analyser was connected to the RF port on the EUT using suitable attenuation and RF cable. An RF level offset was entered on the signal analyser to compensate for the loss of the attenuator and RF cable.

5.2.6. Transmitter Radiated Emissions**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Date:	21 July 2014
Test Sample IMEI:	352025060307270		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	As detailed in ANSI C63.10 Sections 6.3 and 6.5 referencing ANSI C63.4
Frequency Range	30 MHz to 1000 MHz

Environmental Conditions:

Temperature (°C):	25
Relative Humidity (%):	30

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. The preliminary scans showed similar emission levels below 1 GHz, for each channel of operation. Therefore final radiated emissions measurements were performed with the EUT set to channel 11 only.
3. All emissions shown on the pre-scan plots were investigated and found to be ambient, or >20 dB below the applicable limit or below the measurement system noise floor. Therefore the highest peak noise floor reading of the measuring receiver was recorded in the table below.
4. Measurements below 1 GHz were performed in a semi-anechoic chamber (Asset Number K0001) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. No spurious emissions were detected above the noise floor of the measuring receiver therefore the highest peak and average noise floor readings of the measuring receiver were recorded as shown in the tables below.

4. Pre-scans above 1 GHz were performed in a fully anechoic chamber (Asset Number K0002) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. All measurement antennas were placed at a fixed height of 1.5 metres above the test chamber floor, in line with the EUT. Final measurements above 1 GHz were performed in a semi-anechoic chamber (Asset Number K0001) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. 5.2.7. Transmitter Band Edge Radiated Emissions**Test Summary:**

Test Engineers:	Andrew Edwards & David Doyle	Test Dates:	21 July 2014 to 12 September 2014
Test Sample IMEI:	352025060307270		

FCC Reference:	Parts 15.247(d) & 15.209(a)
Test Method Used:	As detailed in ANSI C63.10 Section 6.9.2 & FCC KDB 558074 Section 11

Environmental Conditions:

Temperature (°C):	21 to 23
Relative Humidity (%):	40 to 48

Note(s):

- The customer declared the following data rates to be used for all measurements as:
 - o 802.11b – DBPSK / 1 Mbps
 - o 802.11g – BPSK / 6 Mbps
 - o 802.11n HT20 SISO – BPSK / 6.5 Mbps / MCS0
 - o 802.11n HT20 MIMO – BPSK / 6.5 Mbps / MCS0
- Final measurements were performed with the above configurations.
- For 802.11n HT20 SISO, the EUT was transmitting from Port 1 only as this Port emits the highest output power level and was therefore deemed to be worst case. For 802.11n MIMO, the EUT was transmitting from both ports.
- The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
- The maximum conducted (average) output power was previously measured. In accordance with FCC KDB 558074 Section 11.1(b), the lower band edge measurement should be performed with a peak detector and the -30 dBc limit applied.
- * -30 dBc limit.

6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
AC Conducted Spurious Emissions	0.15 MHz to 30 MHz	95%	±4.69 dB
Minimum 6 dB Bandwidth	2.4 GHz to 2.4835 GHz	95%	±3.92 %
Duty Cycle	2.4 GHz to 2.4835 GHz	95%	±1.14 %
Spectral Power Density	2.4 GHz to 2.4835 GHz	95%	±1.13 dB
Conducted Maximum Output Power	2.4 GHz to 2.4835 GHz	95%	±1.13 dB
Radiated Spurious Emissions	30 MHz to 1 GHz	95%	±5.65 dB
Radiated Spurious Emissions	1 GHz to 25 GHz	95%	±2.94 dB

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
