1.4 Product Information

1.4.1 Technical Description

The Equipment Under Test (EUT) was a laptop computer with Bluetooth, Bluetooth Low Energy and 802.11 a/b/g/n/ac/ax capabilities in the 2.4 GHz and 5 GHz bands

1.4.2 Test Set-up

For conducted tests, a conducted test point was provided by the manufacturer via a UFL connector and cable. The loss of these test cables were known and compensated for in any conducted measurements.

For tests in SISO operation, conducted tests were performed on the Core with the highest antenna gain as Core 0 and Core 1 are identical but with unequal antenna gains. The EUT supports TxBF on Core 0 + Core 1.

Bluetooth BDR/EDR was assessed as a FHSS system. The EUT supports Bluetooth on the following mode of operations across it's antenna ports:

- BT Core 0 – SISO (iPA and ePA)
- BT Core 1 – SISO (iPA and ePA)
- BT Core 0 + BT Core 1 - TxBF (iPA and ePA)

For all tests, the EUT was put into a continuous transmit test mode with the manufacturer's test commands via a script running in the EUTs terminal application. The EUT then transmitted the required type of modulation/packet type on either a static channel selected within the test script or frequency hopping over the maximum number of supported channels.

All testing was performed with the EUT powered via a 120 V AC, 60 Hz source.

1.4.3 Antenna Gain Table (2.4GHz Bluetooth)

Antenna Port	Frequency Range (MHz)	Peak Gain (dBi)	Conducted Cable Loss (dB)
BT Core 0	2400 to 2480	3.22	1.0
BT Core 1	2400 to 2480	4.03	1.0

1.5 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

2.5.4 Test Method

Peak power measurements were performed in accordance with ANSI C63.10 11.9.1.3 PKPM1 and average measurements in accordance with clause 11.9.2.3.2 Method AVGPM-G.

Both EUT antennas are less than 6 dBi (3.22 dBi and 4.03 dBi for Cores 0 & 1 respectively). This means for non-TxBF modes, the 1 Watt FCC conducted limit does not need to be reduced, and the ISED 1 Watt conducted limit is more stringent than the 4 Watt (36 dBm) EIRP limit. The conducted non-TxBF results presented below can therefore be directly compared to the 1 Watt (30 dBm) limit to show compliance.

For TxBF the combined powers were calculated using the measure and sum method. Both the power per chain and the antenna gains differed, therefore directional antenna gain was calculated using the worst-case highest antenna gain, two transmit chains, and a single correlated spatial stream as per the first formula in KDB 662911 D01 v02r01 section e) (ii) with $N_{SS} = 1$ and $G_{ANT MAX}$ of 4.03 dBi. This resulted in a directional gain of 7.03 dBi. This results in:

- the 1 Watt (30 dBm) FCC conducted limit for a maximum of 6 dBi antenna gain being reduced by 1.03 dB to 29.0 dBm.
- the 4 Watt (36 dBm) ISED EIRP limit minus 7.03 dBi directional gain, also resulting in an equivalent conducted limit of 29.0 dBm.
