Applicant: Allen Telecom
108 Rand Park Drive
Suite 240
Garner, NC 27529

Equipment Under Test: BRITECELL 800/900
(E.U.T.)

In Accordance With: FCC Part 24, Subpart D
and Part 90, Subpart I

Tested By: Nemko Dallas Inc.

Section 1. Summary of Test Results

Manufacturer: Allen Telecom

Model No.: BRITECELL 800/900 Dual Band

Serial No.: 032001708

General: **All measurements are traceable to national standards.**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 90, Subpart I and Part 24, Subpart D

Frequency Stability	24.135	Complies
	90.213	Complies
Transient Frequency Behavior	90.214	N/A

Footnotes For N/A's:

This equipment does not provide a means to modulate the input signal with an audio signal.

The device does not have an audio low pass filter

This equipment does not provide audio modulation capability and therefore does not limit modulation.

The RF carrier is not keyed. The amplifier is always active.

Section 6. Field Strength of Spurious Emissions

NAME OF TEST: Field Strength of Spurious Emissions	PARA. NO.: 2.993
TESTED BY: David Light	DATE: 7/30/03

Test Results: Complies.**Test Data:** There were no emissions detected above the noise floor which was at least 30 dB below the spec limit. Tests were performed with a carrier in each band of operation.**Test equipment used:** 1464-1304-1484-1485-1016**Test Method:** TIA/EIA-603-1992, Section 2.2.12

The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The spurious emissions were measured at a distance of 3 meters. The EUT was then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna was fed with a signal at the spurious frequency. The level of the signal was adjusted to repeat the previously measured level. The resulting erp is the signal level fed to the reference antenna corrected for gain referenced to a dipole.

NAME OF TEST: RF Power Output	PARA. NO.: 2.985
--------------------------------------	-------------------------

Minimum Standard: Para. No. 90.205(a). The maximum allowable station ERP is dependent upon the stations HAAT and required service area and will be authorized in accordance with Table 1 of 90.205(d).

Method Of Measurement:

Detachable Antenna:

The peak power at antenna terminals is measured using an in-line peak power meter. Power output is measured with the maximum rated input level.

NAME OF TEST: **Field Strength of Spurious****PARA. NO.:** **2.993****Test Method:** TIA/EIA-603-1992, Section 2.2.12

The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The spurious emissions were measured at a distance of 3 meters. The EUT was then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna was fed with a signal at the spurious frequency. The level of the signal was adjusted to repeat the previously measured level. The resulting erp is the signal level fed to the reference antenna corrected for gain referenced to a dipole.

Minimum Standard: Para. No. 90.210, see table 1 for applicable mask.
