Section 1. Summary of Test Results

Manufacturer: Allen Telecom

Model No.: MR801BI Power and MR801BI

Serial No.: 12

General: **All measurements are traceable to national standards.**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 90, Subpart I.

Footnotes For N/A's:

The system is a rf amplifier/repeater and does not contain modulation circuitry; therefore modulation performance tests are not applicable.

The repeater tested does not perform frequency band translation; therefore frequency stability test is not applicable.

Description of Operation

The MR801Bi and MR801Bi Power is a signal coverage enhancer used in the SMR(Specialized Mobile Radio) bands. The MR801Bi can operate with both low and high power amplifier modules. A system may operate with both low power (MR801Bi) and high power (MR801Bi Power) amplifiers in the same chassis simultaneously.

The conversion modules shown in the diagram below can be either a variable bandwidth or channelized (1 - 25kHz channel per module). Much of the data presented in this report was performed with the variable bandwidth modules. Testing was also performed on the channelized conversion modules but due to the magnitude of test data, only worst-case results are reported (usually the results with variable bandwidth modules).

NAME OF TEST: Occupied Bandwidth	PARA. NO.: 2.989
TESTED BY: Ron Gaytan	DATES:12/14, 16, 20-22, 27/99, 1/13, 14, 17/00

Test Results: Complies**Test Data:** See attached graph(s).

Occupied Bandwidth was evaluated by comparing the output spectrum to the input spectrum. Data is presented for the variable bandwidth module as worst-case. Data for the channelized module was also evaluated but, in the interest of brevity, is not presented here.

Calibration interval on all items is typically 12 months from the calibration date shown. Where relevant, measuring equipment is subjected to in-service checks between testing. Should any measurement be utilized beyond its scheduled calibration date, the measuring equipment is subjected to in service checks prior to use. KTL shall notify clients promptly, in writing, of identification of defective equipment that casts doubt on the validity of results given in this report.

ANNEX A - TEST METHODOLOGIES

EQUIPMENT: MR801Bi POWER AND MR801Bi
FCC ID: BCR-RPT-MR801Bi

NAME OF TEST: RF Power Output**PARA. NO.: 2.985**

Minimum Standard: Para. No. 90.205(a). The maximum allowable station ERP is dependent upon the stations HAAT and required service area and will be authorized in accordance with Table 1 of 90.205(d).

Method Of Measurement:Detachable Antenna:

The peak power at antenna terminals is measured using an in-line peak power meter. Power output is measured with the maximum rated input level.

Integral Antenna:

If the antenna is not detachable from the circuit then the Peak Power Output is derived from the peak radiated field strength of the fundamental emission by using the plane wave relation $GP/4\pi R^2 = E^2/120\pi$ and proceeding as follows:

$$P = \frac{E^2 R^2}{30G} = \frac{E^2 3^2}{30G}$$

where,

P = the equivalent isotropic radiated power in watts

E = the maximum measured field strength in V/m

R = the measurement range (3 meters)

G = the numeric gain of the transmit antenna in relation to an isotropic radiator

An example of attenuation requirement of $50 + 10 \log P$ is equivalent to -20 dBm (1×10^{-5} Watts) at the antenna terminal. We determine the field strength limit by using the plane wave relation.

$$GP/4\pi R^2 = E^2/120\pi$$

For emissions ≤ 1 GHz:

G = 1.64 (Dipole Gain)

P = 10^{-5} Watts (Maximum spurious output power)

R = 3m (Measurement Distance)

$$E = \frac{\sqrt{30GP}}{R} = E = \frac{\sqrt{30 \times 1.64 \times 10^{-5}}}{3} = 0.00739 \text{ V / m} = 77.4 \text{ dBmV / m}$$

For emissions > 1 GHz:

G = 1 (Isotropic Gain)

P = 1×10^{-5} Watts (Maximum spurious output power)

R = 3m (Measurement Distance)

$$E = 77.4 - 20 \log \sqrt{1.64} = 75.2 \text{ dBmV / m@3m}$$
