[Environment]

Temperature : 20 °C Humidity : 56 %

[Note]

- 1) The spectrum was scanned from 30 MHz to 1.7 GHz, and all emission not reported were less than 10 dB μ V at meter reading.
- 2) The correction factor consist of the voltage loss of the impedance matching transformer (50 Ω : 75 Ω) and the coaxial cable used for the test.

[Sample calculation]

Frequency : 101 [MHz] (VHF 2ch Fundamental)
Meter Reading : 22.3 [dB μ V]
Correction Factor : 6.5 [dB]
Conversion Factor : -48.8 [dB] (dB μ V to dBnW)

Then, the antenna Power Conduction is calculated as follows.

$$\text{Antenna Power Conduction} = 22.3 + 6.5 - 48.8 = -20.0 \text{ [dBnW]}$$

[Summary of Test Results]

Minimum margin was 6.7 dB at 1202 MHz(UHF 28ch) at 2nd harmonic.

- (×) The second stage(IF Amp) noise figure contribution did not exceed 0.3dB.
 (×) 4dB is subtracted from the measured noise figure, because a power splitter is equiped in VCR.

The noise figure contribution of IF amplifier following the measurement point:

$$\Delta F = 10 \log_{10} \left\{ 1 + \frac{F_2 - 1}{F_1 \times G_1} \right\}$$

where, ΔF : Noise figure contribution of the amplifier following the measurement point in dB.

F_1 : Noise figure from receiver antenna input terminal to measurement point as power ratio.

F_2 : Noise figure of that IF amplifier as power ratio.

G_1 : Gain of circuit from receiver antenna input terminals to measurement point as a power gain.

[Environment]

Temperature : 20 °C Humidity : 56 %

[Summary of Test Results]

Minimum margin was 7.3 dB at 801.25 MHz, 69ch.

Tested Date : February 5, 1999
