2 Technical Test

2.1 Summary of Test Results

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 25 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are conform with specifications ANSI C63.2-1987 clause 15 and ANSI C63.4-1992 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63-4-1992 clause 4.2.

Antennas are conform with ANSI C63.2-1996 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna

200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna

1GHz: Average, RBW 1MHz, VBW 10 MHz, waveguide horn

The product fullfills also the requirements for CANADA RSS-210

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

Final verdict : PASS

Remark :

During all radiated tests the equipment under test was powered from a "Test board" (Bar Code Printer B-415-GH25-QQ-FE) see test setup and photographs.

Time of occupancy (dwell time) for DH1

§15.247(a1 iii)

The system makes worst case 1600 hops per second or 1 time slot has a length of 625µs with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So you have each channel 10.13 times per second and for 31.6 seconds you have 320.11 times of appearance .

Each tx-time per appearance is 381.162 µs.

So we have $320.11 * 381.162 \mu s = 122.014 \text{ ms}$ per 31.6 seconds.

Time of occupancy (dwell time) for DH3

§15.247(a1 iii)

A DH3 Packets need 3 time slots for transmit and 1 for receiving, then the system makes worst case 400 hops per second with 79 channels. So you have each channel 5.1 times per second and for 31.6 seconds you have 161.16 times of appearance .

Each tx-time per appearance is 1.624 ms.

So we have $161.16 * 1.624 \text{ ms} = 261.724 \text{ ms}$ per 31.6 seconds.

Time of occupancy (dwell time) for DH5

§15.247(a1 iii)

At DH5 Packets you need 5 time slots for transmit and 1 for receiving, so the system makes worst case 266,7 hops per second with 79 channels. So you have each channel 3.36 times per second and for 31.6 seconds you have 106.176 times of appearance .

Each tx-time per appearance is 2.866 ms.

So we have $106.176 * 2.866 \text{ ms} = 304.3 \text{ ms}$ per 31.6 seconds.

Time of occupancy (dwell time) for page mode /Inquiry mode (TX-on time) §15.247(a1 iii)
At paging mode the system makes first hopping with 16 channels. One sequence(called train A) lasts 10 ms. Every 1.28s frequencies change and a second train A starts with different frequencies. After max 7×1.28 s 16 new more distance frequencies (Train B) are used. So we have in the worst case (same frequency is in every train) the following time scedule. First: $7 \times 128 \times 10$ ms. For the next 7 seconds train B with other frequencies.

Then train A and B changes frequently.

⇒ so we have $7 \times 128 \times 161.521 \mu\text{s}$, then 8.96 s other frequencies, then again $7 \times 128 \times 161.521 \mu\text{s}$

⇒ together in 6.4 s maximal 1 sequences =>maximal 0.289 s per 6.4 second period.

Radiated field strength

The field strength was measured with an EMI measuring receiver and 1 MHz RBW / VBW for peak and with 1MHz RBW / 10Hz VBW for average at a distance of 3m.

The correction factor is the summation of path loss, cable loss, antenna gain and amplifier gain.

The value at 2480 MHz is +16.7 dB.
