

2. Photograph for the worst case configuration

3. Sample Calculation

The emission level measured in decibels above one microvolt ($\text{dB}\mu\text{V}$) was converted into microvolt per meter ($\mu\text{V}/\text{m}$) as shown in following sample calculation.

For example :

Measured Value at	<u>59.14MHz</u>	4.0 $\text{dB}\mu\text{V}$
+ Antenna Factor		7.8 dB
+ Cable Loss		1.4 dB
- Preamplifier		0.0 dB
- Distance Correction Factor *		0.0 dB
= Radiated Emission		13.2 $\text{dB}\mu\text{V}/\text{m}$ (= 4.6 $\mu\text{V}/\text{m}$)

* Extrapolated from the measured distance(1.5m) to the specified distance(3m) by an inverse linear distance extrapolation.
