EMI - TEST REPORT

- FCC Part 15.407 and RSS210 Annex 9 -

Test Report No. :	T34325-02-01HS	08 June 2011 Date of issue
--------------------------	-----------------------	-------------------------------

Type / Model Name : Small Engine

Product Description : WLAN-Module with Host

Applicant : Bang & Olufsen A/S

Address : Peter-Bangs-Vej 15

7600 STRUER, DENMARK

Manufacturer : Bang & Olufsen A/S

Address : Peter-Bangs-Vej 15

7600 STRUER, DENMARK

Licence holder : Bang & Olufsen A/S

Address : Peter-Bangs-Vej 15

7600 STRUER, DENMARK

Test Result according to the standards listed in clause 1 test standards:	POSITIVE
--	-----------------

The test report merely corresponds to the test sample.
It is not permitted to copy extracts of these test results
without the written permission of the test laboratory.

1 TEST STANDARDS

The tests were performed according to following standards:

FCC Rules and Regulations Part 15, Subpart A - General (September, 2010)

Part 15, Subpart A, Section 15.31	Measurement standards
Part 15, Subpart A, Section 15.33	Frequency range of radiated measurements
Part 15, Subpart A, Section 15.35	Measurement detector functions and bandwidths

FCC Rules and Regulations Part 15, Subpart B - Unintentional Radiators (September, 2010)

Part 15, Subpart B, Section 15.107	AC Line conducted emissions
Part 15, Subpart B, Section 15.109	Radiated emissions, general requirements

FCC Rules and Regulations Part 15, Subpart C - Intentional Radiators (September, 2010)

Part 15, Subpart C, Section 15.203	Antenna requirement
Part 15, Subpart C, Section 15.204	External radio frequency power amplifiers and antenna modifications
Part 15, Subpart C, Section 15.205	Restricted bands of operation
Part 15, Subpart C, Section 15.207	Conducted limits
Part 15, Subpart C, Section 15.209	Radiated emission limits, general requirements
Part 15, Subpart C, Section 15.212	Modular transmitters

FCC Rules and Regulations Part 15, Subpart E – Unlicensed National Information Infrastructure Devices (September, 2010)

Part 15, Subpart E, Section 15.407	Operation within the bands 5.15 - 5.25 GHz, 5.25 - 5.35 GHz, 5.47 - 5.725 GHz and 5.725 - 5.825 GHz
------------------------------------	---

FCC Rules and Regulations Part 1, Subpart I - Procedures Implementing the National Environmental Policy Act of 1969

Part 1, Subpart I, Section 1.1310	Radiofrequency radiation exposure limits
Part 1, Subpart 2, Section 2.1093	Radiofrequency radiation exposure evaluation: portable device

OET Bulletin 65, 65A, 65B, 65C Edition 97-01, August 1997 – Evaluating Compliance with FCC Guidelines for Human Exposure to Radio Frequency Electromagnetic Fields.

2 SUMMARY

2.1 Test result summary

WLAN devices using digital modulation:

Operating in the 5150 MHz - 5350 MHz and 5475 MHz – 5725 MHz band:

FCC Rule Part	RSS Rule Part	Description	Result
15.207(a)	RSS Gen, 7.2.4.	AC power line conducted emissions	passed
15.407(a)		26 dB EBW	passed
15.407(a)	RSS210, A9.2	Conducted output power and PSD	passed
15.407(a)(6)		Peak excursion	passed
15.407(b)	RSS210, A9.2	Undesirable emissions	passed
15.205(a)	RSS-Gen, 7.2.2	Emissions in restricted bands	passed
15.407(g)	RSS-Gen, 7.2.6	Frequency stability	passed
15.407(f)	RSS210, A9.2	Maximum permissible exposure (MPE)	passed
15.407(h)(1)	RSS210, A9.2	TPC	not applicable
15.407(a)	RSS210, A9.2	Antenna requirement	passed
OET Bulletin 65	RSS102, 3.2	Co-location, Co-transmission	passed
15.111(a)	RSS-Gen, 6.2	Receiver spurious emissions, conducted	not applicable
15.109(a)	RSS-Gen, 6.1	Receiver spurious emissions, radiated	passed
	RSS210, A9.2	99% EBW	passed

The mentioned RSS Rule Parts in the above table are related to:

RSS Gen, Issue 3, December 2010

RSS 210, Issue 8, December 2010

RSS 102, Issue 4, March 2010

FCC:BV5SMALLENGINE

GENERAL REMARKS:

The EUT “small engine” is a WLAN module with host PCB. For the compliance testing the “small engine” is implemented in a reference integration BeoSound5-Encore to provide with the necessary operating voltages and control interfaces.

Available Features:

The “small engine” is compatible with 802.11n technology. It is operating in the 5 GHz frequency bands. The operation in the 2.4 GHz band is disabled by firmware. The EUT can operate as client only. The client has no radar detection and no TPC. The EUT has no ad hoc modes. The output power is not accessible by the user. The EUT use the MIMO function with multiple antennas without beam forming. In legacy mode only one antenna is active, this means a transmission of completely uncorrelated signals.

- 802.11a mode 5.150 GHz – 5.250 GHz
 5.250 GHz – 5.350 GHz
 5.470 GHz – 5.725 GHz
- 802.11n mode 5.150 GHz – 5.250 GHz
 5.250 GHz – 5.350 GHz
 5.470 GHz – 5.725 GHz

The module use OFDM modulation and is capable to provide following data rates:

- 802.11a 54, 48, 36, 24, 18, 12, 9, 6 Mbps
- 802.11n HT20, MCS 0 – 7
- 802.11n HT40, MCS 0 – 15

4 TEST ENVIRONMENT

4.1 Address of the test laboratory

mikes-testingpartners gmbh
Ohmstrasse 2-4
94342 STRASSKIRCHEN
GERMANY

4.2 Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

Temperature: 15-35 ° C

Humidity: 30-60 %

Atmospheric pressure: 86-106 kPa

4.3 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader may notice that tolerances within the calibration of the equipment and facilities may cause additional uncertainty. The measurement uncertainty is calculated for all measurements listed in this test report acc. to CISPR 16-4-2 „Uncertainties, statistics and limit modelling – Uncertainty in EMC measurement“ and documented in the mikes-testingpartners gmbh quality system acc. to DIN EN ISO/IEC 17025. For all measurements shown in this report, the measurement uncertainty of the test laboratory, mikes-testingpartners gmbh, is below the measurement uncertainty as defined by CISPR. Therefore, no special measures must be taken into consideration with regard to the limits according to CISPR. Furthermore, component diversity and modifications in production process of devices may result in additional deviation. If necessary, refer to the test lab for the actual measurement uncertainty for the specific test. The manufacturer has the sole responsibility of continued compliance of the EUT.

4.4 Measurement protocol for FCC

4.4.1 GENERAL INFORMATION

4.4.1.1 Test methodology

Conducted and radiated disturbance testing is performed according to the procedures set out by the International Special Committee on Radio Interference (CISPR) Publication 22, European Standard EN 55022 as shown under section 1 of this report.

FCC:BV5SMALLENGINE

4.4.1.2 Justification

The equipment under test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral using the appropriate impedance characteristic or left unterminated. Where appropriate, cables are manually manipulated with respect to each other thus obtaining maximum disturbances from the unit.

4.4.2 **DETAILS OF TEST PROCEDURES**General Standard information

The test methods used comply with CISPR Publication 22, EN 55022 - "Information technology equipment - Radio disturbance characteristics - Limits and methods of measurement" and with ANSI C63.4 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". In compliance with 47 CFR Part 15 Subpart A, Section 15.38 testing for FCC compliance may be achieved by following the procedures set out in ANSI C63.4 and applying the CISPR 22 limits.

4.4.3 **Conducted emission**Description of measurement

The final level, expressed in dB μ V, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the FCC limit or to the CISPR limit.

To convert between dB μ V and μ V, the following conversions apply:

$$\begin{aligned} \text{dB}\mu\text{V} &= 20 \cdot \log(\mu\text{V}); \\ \mu\text{V} &= 10^{(\text{dB}\mu\text{V}/20)}; \end{aligned}$$

Conducted emissions on the 50 Hz and/or 60 Hz power interface of the EUT are measured in the frequency range of 150 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection and a Line Impedance Stabilization Network (LISN) with 50 Ω /50 μ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimetres above the floor and is positioned 40 centimetres from the vertical ground plane (wall) of the screen room. If the minimum limit margin of a peak mode measurement appears to be less than 20 dB, the emissions are remeasured using a tuned receiver with quasi-peak and average detection and recorded on the data sheets.

FCC:BV5SMALLENGINE

4.4.4 Radiated emission (electrical field 30 MHz - 1 GHz)

Description of measurement

Spurious emissions from the EUT are measured in the frequency range of 30 MHz to 1000 MHz using a tuned receiver and appropriate broadband linearly polarised antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and quasi-peak detection. Table top equipment is placed on a 1.0 X 1.5 m non-conducting table 80 centimetres above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. The setup of the equipment under test is established in accordance with ANSI C63.4. The interface cables that are closer than 40 centimetres to the ground plane are bundled in the center in a serpentine fashion so that they are at least 40 centimetres from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screened room located outside the test area. The antenna is positioned 3, 10 or 30 meters horizontally from the EUT and is repeated vertically. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters and the EUT is rotated 360 degrees. The final level in dBµV/m is calculated by taking the reading from the EMI receiver (Level dBµV) and adding the correction factors and cable loss factor (dB). The FCC or CISPR limit is subtracted from this result in order to provide the limit margin listed in the measurement protocol.

The resolution bandwidth setting:

30 MHz – 1000 MHz: RBW: 120 kHz

Example:

Frequency Delta (MHz)	Level (dBµV)	+	Factor (dB)	=	Level (dBµV/m)	-	CISPR Limit (dBµV/m)	=	(dB)
719.0	75.0	+	32.6	=	107.6	-	110.0	=	-2.4

4.4.5 Radiated emission (electrical field 1 GHz - 40 GHz)

Description of measurement

Radiated emissions from the EUT are measured in the frequency range 1 GHz up to the maximum frequency as specified in 47 CFR Part 15, Subpart A, Section 15.33, using a spectrum analyser and appropriate linearly polarized antennas. Table top equipment is placed on a 1.0 X 1.5 metre non-conducting table 80 centimetres above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. The setup of the equipment under test is following set out in ANSI C63.4. The interface cables that are closer than 40 centimetres to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimetres from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screened room located outside the test area. Measurements are made in both the horizontal and vertical polarization planes in a fully anechoic room using a spectrum analyser set to max peak detector function and a resolution 1 MHz and video bandwidth 3 MHz for peak and 10 Hz for average measurement. The conditions determined as worst case will then be used for the final measurements. When the EUT is larger than the beam width of the measuring antenna it will be moved over the surface for the four sides of the equipment. Where appropriate, the test distance may be reduced in order to detect emissions under better uncertainty and are calculated at the specified test distance.

FCC:BV5SMALLENGINE

4.5 Determination of worst case measurement conditions

Measurements have been made in all three orthogonal axes and the settings of the EUT were changed to locate at which position and at what setting of the EUT produce the maximum of the emissions. For the further measurement the EUT is set in X position.

The tests are carried out in the following frequency bands:

5.15 - 5.25 GHz, 5.25 - 5.35 GHz and 5.47 - 5.725 GHz

Preliminary tests were performed to find the worse case mode from all possible combinations between available modulations, data rates and small antenna system is determined through pre-scans. The maximum output power depends on used data rate. As worse case the HT20 mode (data rate of 6.5 Mbps with 1 spatial stream (BW = 20 MHz), 1 TX chain) and HT40 mode (data rate of 27 Mbps with 2 spatial streams (BW = 40 MHz)) is used. The EUT is controlled for several tests with special test software used for testing only (RALINK using ATE commands) where continuous signals are needed. For the tests a duty cycle (x) of x = 1 is set.

Following channels and test modes were selected for the final test as listed below:

HT20 mode:

Technology	Available channels	Tested channels	Modulation	Modulation type	Data rate (Mbps)
802.11n	36 - 140	36, 40, 48 52, 56, 64 100, 116, 140	OFDM	BPSK	6.5, MCS=0 (BW=20 MHz)

HT40 mode:

Technology	Available channels	Tested channels	Modulation	Modulation type	Data rate (Mbps)
802.11n	38 - 134	38, 46 54, 62 102, 110, 134	OFDM	BPSK	27, MCS=8 (BW=40 MHz)

802.11a mode:

Technology	Available channels	Tested channels	Modulation	Modulation type	Data rate (Mbps)
802.11a	36 - 140	36, 40, 48 52, 56, 64 100, 116, 140	OFDM	BPSK	6, MCS=0 (BW=20 MHz)

FCC:BV5SMALLENGINE

5 TEST CONDITIONS AND RESULTS

5.1 Conducted emissions

For test instruments and accessories used see section 6 Part A 4.

5.1.1 Description of the test location

Test location: Shielded Room S2

5.1.2 Photo documentation of the test set-up

FCC:BV5SMALLENGINE

5.1.3 Applicable standard

According to FCC Part 15C, Section 15.207(a):

Except as shown in paragraphs (b) and (c) of this Section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table.

Frequency of Emission (MHz)	Conducted Limit (dBμV)	
	Quasi-peak	Average
0.15-0.5	66 to 56 *	56 to 46 *
0.5-5	56	46
5-30	60	50

* Decreases with the logarithm of the frequency

5.1.4 Description of Measurement

The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection and a line impedance stabilization network (LISN) with 50Ω/50 μH (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimetres above the floor and is positioned 40 centimetres from the vertical ground plane (wall) of the screen room. If the minimum limit margin appears to be less than 20 dB with a peak mode measurement, the emissions are remeasured using a tuned receiver with quasi-peak and average detection and recorded.

To convert between dBμV and μV, the following conversions apply:

$$\text{dB}\mu\text{V} = 20 \log \mu\text{V}$$

$$\mu\text{V} = 10^{(\text{dB}\mu\text{V}/20)}$$

5.1.5 Test result

Frequency range: 0.15 MHz - 30 MHz

Min. limit margin -1.0 dB at 0.64 MHz

The requirements are **FULFILLED**.

Remarks: For detailed test result please see following test protocols.

FCC:BV5SMALLENGINE

5.2 26 dB emission bandwidth

For test instruments and accessories used see section 6 Part MB.

5.2.1 Description of the test location

Test location: AREA4

5.2.2 Photo documentation of the test set-up**5.2.3 Applicable standard**

According to FCC Part 15E, Section 15.407(i):

The emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum of the modulated carrier.

5.2.4 Description of Measurement

The bandwidth was measured at an amplitude level reduced from the reference level by a specified ratio of -26 dB. The reference level is the level of the highest amplitude of the signal observed from the transmitter frequency. The spectrum analyser function "n-dB-down" is used to determine the bandwidth.

FCC:BV5SMALLENGINE

5.3 Maximum conducted output power

For test instruments and accessories used see section 6 Part CPC 3.

5.3.1 Description of the test location

Test location: AREA4

5.3.2 Photo documentation of the test set-up

5.3.3 Applicable standard

According to FCC Part 15E, Section 15.407(a):

The maximum conducted output power over the frequency band of operation shall not exceed the effective values. If transmitting antennas of directional gain are greater than 6 dBi are used, the maximum conducted output power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

5.3.4 Description of Measurement

The output power is measured using the power meter method according ANSI C63.10, clause 6.10.2.2. The EUT is set while measuring in TX continuous mode with a duty cycle, $x = 1$. The total output power is summed over all antenna terminals of the multiple antenna system.

FCC:BV5SMALLENGINE

	HT40, $11 + 10 \log B = 26.9$	490
5.470 - 5.725	24	250
	HT20, $11 + 10 \log B = 23.8$	240
	HT40, $11 + 10 \log B = 26.9$	490

Note: The lower limit applies!

The requirements are **FULFILLED**.

Remarks: This test has been performed conducted at the 20 cm antenna cable of WLAN module.

FCC:BV5SMALLENGINE

5.4 Peak power spectral density

For test instruments and accessories used see section 6 Part CPC 3.

5.4.1 Description of the test location

Test location: AREA 4

5.4.2 Photo documentation of the test set-up**5.4.3 Applicable standard**

According to FCC Part 15E, Section 15.407(a):

For the defined operating bands the peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than the appropriate limit in any 1 MHz band during any time interval of continuous transmission.

5.4.4 Description of Measurement

The measurement is performed using the procedure set out in DA 02-2138, PSD Method 2. For this MIMO transmitter the antenna output 1 is measured and the output 2 is taken into account with the formula according OET 662911, $10 \log(N)$, where N is the number of outputs. The total sum is calculated to add a correction factor of 3 dB ($10 \log 2$) to the analyser reading of each antenna output.

Settings on the spectrum analyzer:

RBW: 1 MHz, VBW: 3 MHz, Sweep time: auto, Detector: SA, Sweep count: 100

FCC:BV5SMALLENGINE

5.5 Peak excursion

For test instruments and accessories used see section 6 Part **MB**.

5.5.1 Description of the test location

Test location: AREA 4

5.5.2 Photo documentation of the test set-up

5.5.3 Applicable standard

According to FCC Part 15E, Section 15.407(a)(6):

The ratio of the peak excursion of the modulation envelope (measured using a peak hold function) to the maximum conducted output power (measured like before) shall not exceed 13 dB across any 1 MHz bandwidth or the emission bandwidth whichever is less.

5.5.4 Description of Measurement

The transmitter output was connected to the spectrum analyzer. Using peak detector and "MAX HOLD" function for Trace 1 with 1 MHz RBW and 3 MHz VBW and Trace 2 with 1 MHz RBW and 300 kHz VBW both traces were recorded. The largest difference between Trace 1 and Trace 2 in any 1 MHz band was noted as maximum *Peak Excursion* value.

FCC:BV5SMALLENGINE

5.6 Undesirable emissions

For test instruments and accessories used see section 6 Part **SER 1**, **SER 2** and **SER 3**.

5.6.1 Description of the test location

Test location: Anechoic Chamber A2

Test location: OATS 1

Test distance: 3 metres

5.6.2 Photo documentation of the test set-up

Open area test site (Test setup for 9 kHz – 30 MHz)

Open area test site (Test setup for 30 MHz – 1000 MHz)

FCC:BV5SMALLENGINE

Anechoic chamber (Test setup for field strength measurement)

Anechoic chamber (Test setup for 18 GHz – 30 GHz)

FCC:BV5SMALLENGINE

Anechoic chamber (Test setup for 30 GHz – 40 GHz)

5.6.3 Applicable standard

According to FCC Part 15E, Section 15.407(b):

For transmitters operating in the defined bands shall not exceed the appropriate emission limit outside of the operating bands.

In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limit specified in Section 15.209(a) (see Section 15.205(c)).

FCC:BV5SMALLENGINE

5.6.4 Description of Measurement

Radiated spurious emissions are measured with the setup set out in ANSI C63.4. If the emission level of the EUT in peak mode complies with the average limit then testing will be stopped and peak values of the EUT will be reported, otherwise, the emission will be measured in average mode again and reported. Up from 8 GHz a HP filter is used. The measurement system for the frequency range 30 - 40 GHz converts the range down to 10 - 20 GHz. A conversion EIRP to Field strength is done with the formula $FS = \sqrt{(EIRP \cdot 30)/D}$; FS (V/m), EIRP (W), D (m).

Spectrum analyzer settings for peak values:

RBW: 1 MHz VBW: 1 MHz Sweep: Auto

Spectrum analyzer settings for average values:

RBW: 1 MHz VBW: 10 Hz Sweep: Auto

5.6.5 Test result

5.6.5.1 Radiated emissions outside of the operation frequency bands

Worst case condition for this measurement:

All radiated measurements are performed with the integrated Antenna 5 dBi and with the EUT settings:

Frequency offset = 27 for radiated sample;

5.7 Frequency stability

For test instruments and accessories used see section 6 Part **MB**.

5.7.1 Description of the test location

Test location: AREA 4

5.7.2 Photo documentation of the test setup**5.7.3 Applicable standard**

According to FCC Part 15, Subpart E, Section 15.407 (g):

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.

5.7.4 Description of Measurement

This test have been performed over variations in temperature and voltage. The lowest and the highest channel in the operating frequency bands is measured at the 20 dB bandwidth under following conditions:

1. Supply voltage from 100 VAC to 120 VAC at normal temperature
2. Extreme temperature from 0 °C to 40 °C at nominal voltage.

FCC:BV5SMALLENGINE

5.8 Maximum permissible exposure (MPE)

For test instruments and accessories used see section 6 Part **CPC 3**.

5.8.1 Description of the test location

Test location: AREA 4

5.8.2 Photo documentation of the test set-up

5.8.3 Applicable standard

According to FCC Part 15, Section 15.407(f):

U-NII devices are subject to the radio frequency radiation exposure requirements specified in Section 1.1307(b), 2.1091 and 2.1093 of this chapter, as appropriate. All equipment shall be considered to operate in a "general population/uncontrolled" environment. The test methods used comply with ANSI/IEEE C95.1-2005, "IEEE Standard for Safety Levels with respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz".

5.8.4 Description of Measurement

The maximum total power input to the antenna has been measured and conducted as described in clause 5.3 of this document. Through the Friis transmission formula, which is a far field assumption and the known maximum gain of the antenna, the maximum MPE at a defined distance away from the product, can be calculated.

Friis transmission formula:

$$P_d = \frac{P_{out} * G}{4 * \pi * r^2}$$

where

- P_d = power density in mW/cm²
- P_{out} = output power to antenna in mW
- G = gain of antenna (linear scale)
- r = distance between antenna and observation point (cm)

FCC:BV5SMALLENGINE

5.8.5 Test result

For fixed equipment the distance $r = 20 \text{ cm}$;

30 - 300	27.5	0.073	0.2	30
300-1500	---	---	f/1500	30
1500-100000	---	---	1.0	30

f = Frequency (MHz)

The requirements are **FULFILLED**.

Remarks: This test report shows the compliance with the limits for maximum permissible exposure (MPE)
specified in FCC 1.1310 and the criteria to evaluate the environmental impact of human exposure
to radio-frequency (RF) radiation as specified in FCC 1.1307(b).

FCC:BV5SMALLENGINE

5.9 Co-location and Co-transmission**Applicable standard:**

OET Bulletin 65, Edition 97-01, Section 2: Multiple-transmitter sites and complex environments

The MPE limits of FCC vary with frequency. Therefore, in mixed or broadband RF fields where several sources and frequencies are involved, the fraction of the recommended limit (in terms of power density or square of the electric or magnetic field strength) incurred within each frequency interval should be determined, and the sum of all fractional contributions should not exceed 1.0, or 100 % in terms of percentage.

There is no co-location issue the EUT provides with 2 TX streams simultaneously and use MIMO technique which is taken always into consideration.

The requirements are **FULFILLED**.

Remarks: For detailed test results please refer to following test protocols.

5.10 Antenna application - Detailed photos see attachment A**5.10.1 Applicable standard**

According to FCC Part 15C, Section 15.203:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit that broken antennas can be replaced by the user, but the use of a standard antenna jack is prohibited.

The EUT is used with the Antenna ASSY PN: 1551359 for MIMO technique. The antenna is an integrated antenna and is not designed for a change by user.

5.10.2 Antenna requirements

According to FCC Part 15E, Section 15.407(a):

The conducted output power limit specified in paragraph (a) of 15.407 is based on the use of antennas with directional gains that do not exceed 6 dBi. If transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from intentional radiator shall be reduced below the stated values in paragraph (a)(1), (a)(2) and (a)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds the effective value.

The EUT use the antenna ASSY PN: 1551359 for MIMO technique. The antenna gain is 5.0 dBi. No output power reduction results.

FCC:BV5SMALLENGINE

5.11 Receiver spurious emissions, radiated

For test instruments and accessories used see section 6 Part **SER 2** and **SER 3**.

5.11.1 Description of the test location

Test location: Anechoic Chamber A2
Test location: OATS 1
Test distance: 3 metres

5.11.2 Photo documentation of the test set-up

Anechoic chamber (Test setup for field strength measurement)

Open area test site (Test setup for 30 MHz – 1000 MHz)

FCC:BV5SMALLENGINE

5.11.3 Applicable standard

According to RSS-Gen, Section 6.1:

Receivers shall comply with the limits of spurious emissions set out in this section, measured over the frequency range determined in accordance with Section 4.10.

5.11.4 Description of Measurement

Radiated emissions from the EUT in the range $f < 1$ GHz are measured under the circumstances described in point 4.4. In the frequency range of 1 GHz to maximum frequency as specified in section RSS Gen 4.10. For testing above 1 GHz, the emission level of the EUT in peak mode complies with the average limit then testing will be stopped and peak values of the EUT will be reported, otherwise, the emission will be measured again in average mode and reported.

5.11.5 Test result

$f < 1$ GHz

The emission < 1 GHz is independent of the channel setting, therefore the table for channel 36 only.

4 GHz to 12 GHz

12 GHz to 18 GHz

FCC:BV5SMALLENGINE

5.12 99% bandwidth

For test instruments and accessories used see section 6 Part MB.

5.12.1 Description of the test location

Test location: AREA 4

5.12.2 Photo documentation of the test set-up

5.12.3 Applicable standard

According to RSS-Gen Issue 2, 4.6.1:

When an occupied bandwidth is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99% emission bandwidth.

5.12.4 Description of Measurement

The bandwidth was measured with the function "bandwidth measurement" of the spectrum analyser. The EUT is connected via suitable attenuator at the spectrum analyser. The measurement is repeated for every different modulation standard of the EUT and recorded.

Spectrum analyzer settings:

RBW 1% of the selected span
Detector Peak

VBW 3 times RBW
Trace: No max hold

FCC:BV5SMALLENGINE

5.12.5 Test result

HT20 mode:

Spectrum analyzer settings: RBW: 1 MHz VBW: 3 MHz Detector: Peak

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
36	5180	18.16
48	5240	18.16
64	5320	18.32
100	5500	18.32
116	5580	18.32
140	5700	18.16

HT20 mode:

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
36	5180	17.60
48	5240	17.52
64	5320	17.60
100	5500	17.60
116	5580	17.68
140	5700	17.60

HT40 mode:

Spectrum analyzer settings: RBW: 1 MHz VBW: 3 MHz Detector: Peak

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
38	5190	36.32
46	5230	37.76
62	5310	36.32
102	5510	37.60
110	5550	36.32
134	5670	36.64

HT40 mode:

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
38	5190	36.00
46	5230	36.64
62	5310	36.16
102	5510	36.00
110	5550	36.32
134	5670	36.16

FCC:BV5SMALLENGINE

802.11a mode:

Spectrum analyzer settings: RBW: 1 MHz

VBW: 3 MHz

Detector: Peak

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
36	5180	17.36
48	5240	17.36
64	5320	17.36
100	5500	17.44
116	5580	17.44
140	5700	17.60

802.11a mode:

Channel number	Center frequency (MHz)	99% bandwidth (MHz)
36	5180	16.40
48	5240	16.48
64	5320	16.48
100	5500	16.48
116	5580	16.48
140	5700	16.48

Remarks:

For detailed test result please refer to following test protocols. The RSS Gen defines no limit for the occupied bandwidth! Only the worst case plots are listed.
