Description of Test Item

The EUT is a Bluetooth Transceiver in a portable DECT transceiver. The Bluetooth part supports BT 2.1 +EDR modulations. This report covers only the BT part.

Exposure Evaluation

The EUT is designed to be worn in a belt clip. For the purposes of exposure evaluation this EUT is a mobile device. The Bluetooth portion of the EUT is exempted from SAR evaluation.

The EUT is exempted from RF Exposure Evaluation to Industry Canada requirements since the output power complies with the power levels of section 2.5.2 of RSS-102 Issue 4.

See attached plots

Channel Separation nominal value: 1.000 MHz

Requirement:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

or:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the system operates with an output power no greater than 125 mW.

No requirements for Digital Transmission Systems.

3.3 Pseudorandom Hopping Algorithm

Para. No.: 15.247 (a)(1)

Test Results: Complies

Measurement Data: /

Requirements:

The channel frequencies shall be selected from a pseudorandom ordered list of hopping frequencies. Each frequency must be used equally by the transmitter.

No requirements for Digital Transmission Systems.

3.4 Occupancy Time

Para. No.: 15.247 (a)(1)(iii)

Test Results: Complies

Measurement Data:

Maximum Number of RF Channels:	79
Maximum Length of RF Burst pr. Channel :	2.91 ms
Time between RF Burst on same RF Channel :	296.25 ms
Time of Occupancy :	310.4 ms

Max Occupancy Time is with DH5 burst:

Time between RF burst on same channel: $3.75 \times 79 \text{ ms} = 296.25 \text{ ms}$

Time of occupancy: $(2.91 \times 400 \times 79) / 296.25 = 310.4 \text{ ms}$

The EUT uses adaptive frequency hopping and will operate with reduced number of channels when interference is detected. Time of Occupancy is independent of number of channels since this is calculated over a period of 0.4 seconds multiplied by the number of hopping channels.

See attached graph.

Requirements:

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

No requirements for Digital Transmission Systems.
