

Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at antenna input terminal:	<u>-1.8</u> (dBm)	*
Maximum peak output power at antenna input terminal:	<u>0.7</u> (mW)	
Antenna gain(maximum):	<u>1.1</u> (dBi)	*
Maximum antenna gain:	<u>1.29</u> (numeric)	
Time Averaging:	<u>100</u> (%)	*
Prediction distance:	<u>20</u> (cm)	*
Prediction frequency:	<u>2442</u> (MHz)	*
FCC MPE limit for uncontrolled exposure at prediction frequency:	<u>1.000</u> (mW/cm ²)	
IC MPE limit for uncontrolled exposure at prediction frequency:	<u>17.15</u> (W/m ²)	
Power density at prediction frequency:	<u>0.000</u> (mW/cm ²)	
This equates to:	<u>0.00</u> (W/m ²)
