

1) The voltage and current drain in the RF section.

T r Q107 [2 S C 4 2 2 7]

	Low (CH20)	Mid(CH55)	High(CH08)
Vce	3.78 V	3.78 V	3.79 V
Ic (mA)	12 mA	11.9 mA	11.9 mA

2) Description of the main circuit

1) Frequency stabilization

This oscillation is the synthesized system and its frequency stabilization will depend on the crystal vibrator characteristic. The frequency allowance will be $\pm 10\text{ppm}$ between -10°C and $+60^\circ\text{C}$.

2) Spurious suppression

In order to suppress the spurious, the filter composed by L and C has been applied in this unit after the power amplification circuit. The circuit is posed below and it is the pi type double low pass filter.

3) Limiting modulation

- 1) We put a diode (limiter) at the AMP output of Compressor (IC101) to limit an amplitude.
- 2) In addition, we apply OP, Amp (IC102 & 109 NJM2100M) at the AF area and its OP Amp's saturation characteristic will limit its modulation.
