2.1049(c) Occupied Bandwidth:

Data in the plots show that all sidebands between 50 & 100% for the authorized bandwidth are attenuated by at least 25dB. From 100 to 250% of the authorized bandwidth they are attenuated by at least 35dB and beyond 250% $43 \log(P_o)$ dB. The plot shows the transmitter modulated with 7000 Hz, adjusted for 50% modulation plus 16 dB. The spectrum analyzer was set with the unmodulated carrier at the top of the screen. The test procedure diagram and occupied bandwidth plots follow.

2.1051 Spurious emissions at antenna terminals(conducted):
Not Applicable no antenna connector.

2.1053(a)(b) Field strength of spurious emissions:

NAME OF TEST: RADIATED SPURIOUS EMISSIONS

REQUIREMENTS: Emissions must be $43 + 10\log(P_o)$ dB below the
mean power output of the transmitter.

$$43 + 10 \log(0.007) = 21.5 \text{ dB}$$

TEST DATA:

Emission Frequency MHz	dBc	Margin dB
171.0	0.0	0.0
1539.3	56	34.50
1710.4	56	34.50
188.2	0.0	0.0

209.1	0.0	0.0
418.2	51	29.50
1672.8	50	28.50

METHOD OF MEASUREMENT: The procedure used was TIA/EIA STANDARD 603.
The spectrum was scanned from 30 to at least the tenth harmonic of the
fundamental using a HP model 8566B spectrum analyzer and an appropriate
antenna. Measurements were made at the open field test site of
TIMCO ENGINEERING INC. located at 849 NW SR 45 Newberry, Florida 32669.

Method of Measuring Radiated Spurious Emissions

2.1055 Frequency stability:
S74.861(e)(4)

Temperature and voltage tests were performed to verify that the frequency remains within the .0050%, (50 ppm)(74.861 e.4) specification limit.

The test was conducted as follows: The transmitter was placed in the temperature chamber at 25 degrees C and allowed to stabilize for one hour. The transmitter was keyed ON for one minute during which four frequency readings were recorded at 15-second intervals. The worse case number was taken for temperature plotting. The assigned channel frequency was considered to be the reference frequency. The temperature was then reduced to -30 degrees C after which the transmitter was again allowed to stabilize for one hour. The transmitter was keyed ON for one minute, and again frequency readings were noted at 15-second intervals. The worst-case number was recorded for temperature plotting. This procedure was repeated in 10-degree increments up to + 50 degrees C.

RESULTS OF MEASUREMENTS: The maximum frequency variation over the temperature range was -26.22 to +16.42 ppm. The maximum frequency variation over the voltage range was -0.25 to +0.37 ppm.
