5 Product Description

Company Name:	Microsoft Corporation
Address:	One Microsoft Way

Functional Description of the EUT:	Wireless input accessory device.
Model:	1616
FCC ID:	C3K1616
IC ID:	3048A-1616
Radio Description:	BT LE (2402- 2480 MHz)
Modulation:	GFSK
EUT Classification:	DTS
Equipment Design State:	DV
Equipment Condition:	Good

5.1 Test Configurations

Test software “nRFgo Studio” (V1.16.0) from Nordic Semiconductor is used to program the EUT.

Since the EUT only supports Advertising mode, channels 0, 19 and 39 are used for as the Low/Mid/High channels of test. Data mode is not supported by the device.

Additionally, the EUT is battery powered and cannot be connected to AC outlet either directly or indirectly. Hence power line conducted emissions test is not applicable for this EUT.

5.2 Environmental Conditions

Ambient air temperature of the test site was within the range of 10 °C to 40 °C (50 °F to 104 °F) unless the EUT specified testing over a different temperature range. Humidity levels were in the range of 10% to 90% relative humidity. Testing conditions were within tolerance and any deviations required from the EUT are reported.

5.3 Antenna Requirements

The antennas are permanently attached and there are no provisions for connection to an external antenna.

5.4 Equipment Modifications

No modifications were made during testing.

8 Test Site Description

8.1 Radiated Emissions Test Site

Radiated measurements are performed in a 3m semi-anechoic chamber manufactured by TDK which fully meets NSA requirements for the frequency range of 30MHz to 1000MHz and SVSWR for 1-18GHz.

A Sunol antenna mast and turntable are used for changing Antenna height and azimuth. For all measurements, the Antenna height is varied from 1 meter to 4 meters and the turn table rotated 360 degrees to determine the highest emissions. A non-conducting 1m x 1.5m x 80cm table is installed on the turntable to support the EUT.

The EUT and its support equipment were exercised and cabling manipulated to maximize each emission.

For radiated emissions above 1GHz, linearly polarized horn antennas are used. RF absorbers cover the ground plane such that the site validation criterion called out in CISPR 16-1-4 is met. For radiated measurements below 1GHz, Linearly polarized broadband antennas are used. The RF absorbers are removed to reveal the ground plane.

8.2 Antenna port conducted measurements

All antenna port conducted measurements are performed on a bench-top setup consisting of a Spectrum Analyzer, Communication tester (where applicable), Power Meter (as necessary), Splitters/Combiners (as necessary), Attenuators and pre-characterized RF cables.

The correction factors between the EUT and the Spectrum Analyzer is added internally in the Analyzer settings. The plots displayed accounts for these correction factors.
