Microsoft EMC Laboratory attests that the product model identified in this report has been tested to and meets the requirements identified in the above standards. The test results in this report solely pertains to the specific sample tested, under the conditions and operating modes as provided by the customer.

This report shall not be used to claim product certification, approval, or endorsement by A2LA or any agency of any Government. Reproduction, duplication or publication of extracts from this test report is prohibited and requires prior written approval of Microsoft EMC Laboratory.

This report replaces the previously issued report #R-TR378-FCCIC-BTLE-4 issued by Microsoft EMC Labs on Oct 13, 2016.

2 Deviations from Standards

None.

3 Facilities and Accreditations

3.1 Test Facility

All test facilities used to collect the test data are located at
Microsoft EMC Laboratory,
17760 NE 67th Ct,
Redmond WA, 98052, USA

3.2 Accreditations

The lab is established and follows procedures as outlined in IEC/ISO 17025 and A2LA accreditation requirements.

A2LA Accredited Testing Certificate Number: 3472.01

FCC Registration Number: US1141

IC Site Registration Numbers: 3048A-3, 3048A-4

3.3 Test Equipment

The site and related equipment are constructed in conformance with the requirements of ANSI C63.4: 2014, CISPR 16-1-1 and other equivalent applicable standards. Test site requirements for measurements above 1 GHz are in accordance with ANSI C63.4 2014.

The calibrations of the measuring instruments, including any accessories that may affect such calibration, are checked frequently to assure their accuracy.

4 Measurement Uncertainty

The following measurement uncertainty levels have been estimated for tests performed on the product, calculated in accordance with ETSI TR 100 028-1, ETSI TS 103 051 and ETSI TS 103 052. This represents an expanded uncertainty expressed at 95% confidence level using a coverage factor $k=2$.

Expanded uncertainty calculations are available upon request.

Test item	Uncertainty	Unit
Radiated disturbance (9kHz to 30 MHz)	6.39	dB
Radiated disturbance (30 MHz to 1 GHz)	5.99	dB
Radiated disturbance (1 GHz to 18 GHz)	5.12	dB
Uncertainty for Conducted Power test	1.277	dB
Uncertainty for Conducted Spurious emission test	2.756	dB
Uncertainty for Bandwidth test	4.98	kHz
Uncertainty for DC power test	0.05	%
Uncertainty for test site temperature	0.5	°C
Uncertainty for test site Humidity	3	%
Uncertainty for time	0.189	%

5 Product Description

Company Name:	Microsoft Corporation
Address:	One Microsoft Way

Customer Contact:	Chaitrali Limaye
Functional Description of the EUT:	Wireless input accessory device with BTLE Radio
Model:	1756
FCC ID:	C3K1756
IC ID:	3048A-1756
Radio Description:	BT LE (2400- 2483.5 MHz)
Modulation:	GFSK (Gaussian Frequency Shift Key)
Antenna Info:	Internal Antenna; Maximum manufacturer stated Antenna Gain: +1.73 dBi
EUT Classification:	DTS
Equipment Design State:	Production Equivalent
Equipment Condition:	Good
Test Sample Details:	Radiated: S/N: 0743511628574 Conducted: S/N: 0743743628574

5.1 Test Configurations

The EUT was preprogrammed to transmit continuously with a constant duty cycle on low, middle, and high channels.

Channel 0: Slow White LED blink.

Channel 19: Fast white LED blink.

Channel 39: Solid white LED blink.

5.2 Environmental Conditions

Ambient air temperature of the test site was within the range of 10 °C to 40 °C (50 °F to 104 °F) unless the EUT specified testing over a different temperature range. Humidity levels were in the range of 10% to 90% relative humidity. Testing conditions were within tolerance and any deviations required from the EUT are reported.

5.3 Antenna Requirements

The antenna is permanently attached. The EUT also has a conducted port out of the radio board specifically for conducted measurements. External antennas are not to be attached to this port.

5.4 Equipment Modifications

No modifications were made during testing.

5.5 Dates of Testing

Testing was performed July 20, 2016- July 29, 2016 and Sep 26, 2016.

8 Test Site Description

8.1 Radiated Emissions Test Site

Radiated measurements are performed in a 3m semi-anechoic chamber, which meets NSA requirements for the frequency range 30 MHz to 1000 MHz.

For measurements above 1 GHz, absorbers are laid out on the ground plane between the receiving antenna and the EUT to meet SVSWR in accordance with the requirements of ANSI C63.4:2014.

8.1.1 Radiated Measurements in 9 kHz- 30 MHz

The EUT is positioned on a turntable at a height of 80cm using a non-conducting table. A passive loop antenna is positioned at 3m from the EUT periphery. The turntable is rotated 360 degrees and the antenna height is maintained at 1m to determine the highest emissions. This was repeated in perpendicular, parallel and ground-parallel polarizations of the measurement antenna. The EUT is also rotated about its three orthogonal orientations to investigate emissions.

8.1.2 Radiated Measurements in 30 MHz- 1000 MHz

The EUT is positioned on a turntable at a height of 80cm using a non-conducting table. A linearly polarized broadband antenna is positioned at 3m from the EUT periphery. The turntable is rotated 360 degrees and the antenna height varied from 1m to 4m to determine the highest emissions. This is repeated for both horizontal and vertical polarizations of the measurement antenna. The EUT is also rotated about its three orthogonal orientations to investigate emissions.

8.1.3 Radiated Measurements above 1GHz

The EUT is positioned on a turntable at a height of 150cm using a device positioner. A linearly polarized antenna is positioned at 3m from the EUT periphery. Guidelines from ANSI C63.10: 2013 were followed with respect to maximizing the emissions. The turntable is rotated 360 degrees, the antenna height maintained at 150cm and the device positioner rotated about its horizontal axis to determine the highest emissions. This is repeated for both horizontal and vertical polarizations of the measurement antenna.

Measurements above 18GHz were performed at a distance of 3m using standard gain horn Antennas.

8.2 Antenna port conducted measurements

All antenna port conducted measurements were performed on a bench-top setup consisting of a spectrum analyzer, power meter (as necessary), attenuators, and pre-characterized RF cables.

The correction factors between the EUT and the Spectrum Analyzer is added internally in the Analyzer settings. The plots displayed account for these correction factors.

9 Test Results- Conducted

9.1 Duty Cycle

9.1.1 Test Requirement:

Reporting and measurement purposes only.

9.1.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10 (2013) American National Standard of Procedure for Compliance Testing of Unlicensed Wireless Devices.

Spectrum Analyzer Settings:

RBW $\geq$ Occupied Bandwidth if possible; otherwise, set RBW to the largest available value

VBW $\geq$ RBW $\geq$ 50/Signal Period

Detector = Peak

Span = 0 Hz

Sweep points > 100

9.1.3 Limits:

Reporting and measurement purposes only.

9.1.4 Test Results:

Frequency (MHz)	Modulation	On Time (ms)	Period (ms)	Duty Cycle (%)	Correction Factor (dB)
2402	GFSK	100	100	100	0

Innovation Science and Economic Development Canada RSS-247 [5.2]

9.2.2 Test Method:

Measurements were performed according to the procedure defined in KDB 558074- Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 V03R05 and ANSI C63.10: 2013.

KDB 558074 Method 8.2

Spectrum Analyzer settings:

RBW= 100 kHz

VBW> 300 kHz

Trace Mode= Peak Detector (Max Hold)

Sweep time= Auto

The in-built functionality of the Spectrum Analyzer is used to measure the 6-dB bandwidth.

9.2.3 Limits:

The 6-dB bandwidth shall be at least 500 kHz.

9.2.4 Test Results:

9.3 Occupied Bandwidth

9.3.1 Test Requirement:

The Occupied Channel Bandwidth is the bandwidth that contains 99 % of the power of the signal.

9.3.2 Test Method:

Measurements are performed according to ANSI C63.10 (2013).

Spectrum Analyzer settings:

Set analyzer center frequency to the nominal EUT channel frequency

Span set to between 1.5 and 5.0 times the DTS bandwidth

RBW to: 1% to 5% of the OBW

VBW $\geq$ 3 RBW

Detector = Peak

Sweep time = auto couple

Trace mode = max hold

Use the 99% power bandwidth function of the instrument.

9.3.3 Limits:

Average Power Method:

KDB 558074 Section 9.2.3.1

Antenna port conducted measurements were performed on a bench-top setup consisting of an average power meter and pre-characterized RF cables.

Total Average Power (dBm)= Measured Average Power (dBm)+ Duty Cycle Correction Factor (dB).

9.4.3 Limits:

15.247: The maximum permissible peak output power is 30 dBm (1 W).

RSS-247: The maximum peak conducted output power shall not exceed 30dBm (1 W) and the maximum radiated output power shall not exceed 36dBm (4 W) EIRP.

9.4.4 Test Results:

10 Test Results- Radiated

10.1 Radiated Spurious and Band Edge Emissions

10.1.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (d)

Innovation Science and Economic Development Canada RSS-247 [5.5] and RSS GEN [8.9]

10.1.2 Test Method:

Measurements were performed according to the procedure defined in KDB 558074 - Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 V03R05 and ANSI C63.10: 2013. Measurements in the 9 kHz- 30 MHz range is performed according to guidelines in ANSI C63.10:2013 and following requirements per KDB 937606.

Radiated spurious measurements were made from 9 kHz to the 10th harmonic of the fundamental frequency of the transmitter. The limit for radiated spurious emissions is per 15.209 and RSS-Gen. Additionally, emissions found in the restricted bands as listed in 15.205 were tested for compliance per limits in 15.209 and RSS-Gen.

The EUT was tested near the low, middle and high channels of operation. Guidelines in ANSI C63.10 2013 were followed with respect to maximizing the emission by rotating the EUT about its vertical and horizontal axis and adjusting the measurement antenna polarization. Worst case maximized data is shown in this test report.

A pre-amp and a high pass filter were required for this test, in order to provide the measuring system with sufficient sensitivity. The peak reading of the emission, after being corrected by the antenna factor, cable loss, pre-amp gain, etc., is the peak field strength.

Sample Calculation:

Field Strength Level: Amplitude (Analyzer level) + AFCL (Antenna Factor and Cable losses) – Amplifier Gain = 50 dBμV + 33 dB – 25 dB = 58dBμV/m

Spectrum Analyzer Settings:

960-1000	500	3	54
Above 1000	500	3	54 (Average) 74 (Peak)

For emissions outside the restricted bands, the 20dBc limit is applied.

10.1.4 Test Result:

Pass.

10.1.5 Test Data:

10.1.5.1 Emissions in 9 kHz- 30 MHz range

Preliminary measurements showed that there were no significant emissions or no emissions above the noise floor below 30MHz and therefore no final measurements were made.

11 AC Line Conducted Emissions

11.1.1 Test Requirements

FCC CFR 47 Rule Part 15.207 (a)

Innovation Science and Economic Development Canada RSS Gen [8.8]

11.1.2 Test Method

Conducted power line measurements are made over the frequency range from 150 kHz to 30 MHz to determine the line-to-ground radio-noise voltage that is conducted from the EUT power-input terminals that are directly (or indirectly) connected to a public power network. The measurements were made using a LISN (Line Impedance Stabilization Network).

The EUT has a USB port and is not supplied with a specific AC/DC adapter. An off-the-shelf adapter and USB cable were used for this test. The EUT is set to continuously transmit on Ch.19.

EMI Receiver Settings:

150 kHz – 30 MHz:

RBW= 9 kHz

VBW $\geq 3 \times$ RBW

Trace Mode: Peak Detector (Max Hold).

Final measurements were performed using Quasi-Peak and Average Detectors.

Span= 150 kHz – 30 MHz

Sweep time= Auto

11.1.3 Limit

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

11.1.4 Test Result:

Not Applicable

11.1.5 Test Data:

Not Applicable: The EUT is battery powered only, and does not connect directly to the AC mains
