1. ATTESTATION OF TEST RESULTS

COMPANY NAME: Microsoft Corporation
1 Microsoft Way
Redmond, WA 98052-8300, USA

EUT DESCRIPTION: Wireless Module

MODEL: HWB-Q93

SERIAL NUMBER: 6-19, 6-25, 6-28

SAMPLE RECEIPT DATE: 2024-06-20 TO 2024-10-10

DATE TESTED: 2024-10-07 TO 2024-11-25

APPLICABLE STANDARDS	
STANDARD	TEST RESULTS
CFR 47 Part 15 Subpart C: 2024	Refer to Section 2
ISED RSS-247 Issue 3: 2023	Refer to Section 2
ISED RSS-GEN Issue 5 + A1 + A2: 2021	Refer to Section 2

UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document.

2. TEST RESULTS SUMMARY

This report contains data/info provided by the customer which can impact the validity of results. UL LLC is only responsible for the validity of results after the integration of the data provided by the customer.

Below is a list of the data/info provided by the customer:

- 1) Antenna gain and type (see section 6.3)

FCC Clause	ISED Clause	Requirement	Result	Comment
See Comment		Duty Cycle	Reporting purposes only	Per ANSI C63.10, Section 11.6.
See Comment	RSS-GEN 6.7	20dB BW/99% OBW	Reporting purposes only	ANSI C63.10 Sections 6.9.2 and 6.9.3
15.247 (a)(1)	RSS-247 (5.1) (b)	Hopping Frequency Separation	Compliant	None
15.247 (a)(1)(iii)	RSS-247 (5.1) (d)	Number of Hopping Channels		
15.247 (a)(1)(iii)	RSS-247 (5.1) (d)	Average Time of Occupancy		
15.247 (b)(1)	RSS-247 (5.4) (b)	Output Power		
See Comment		Average Power	Reporting purposes only	Per ANSI C63.10, Section 11.9.2.3.2.
15.247 (d)	RSS-247 (5.5)	Conducted Spurious Emissions	Compliant	None
15.209, 15.205	RSS-GEN 8.9, 8.10	Radiated Emissions		
15.207	RSS-Gen 8.8	AC Mains Conducted Emissions	Not Performed	See Note 1

NOTE 1: AC Mains emissions testing was not performed since the EUT is a radio module that is powered through a DC internal power supply.

3. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC 47 CFR Part 2, FCC 47 CFR Part 15, ANSI C63.10-2020, KDB 558074 D01 15.247 Meas Guidance v05r02, KDB 414788 D01 Radiated Test Site v01r01, RSS-GEN Issue 5 + A1 + A2, and RSS-247 Issue 3.

4. FACILITIES AND ACCREDITATION

UL LLC is accredited A2LA, certification # 0751.06, for all testing performed within the scope of this report. Testing was performed at the locations noted below.

	Address	ISED CABID	ISED Company Number	FCC Registration
☐	Building: 12 Laboratory Dr RTP, NC 27709, U.S.A	US0067	2180C	825374
☒	Building: 2800 Perimeter Park Dr. Suite B Morrisville, NC 27560, U.S.A		27265	

5. DECISION RULES AND MEASUREMENT UNCERTAINTY

5.1. METROLOGICAL TRACEABILITY

All test and measuring equipment utilized to perform the tests documented in this report are calibrated on a regular basis, with a maximum time between calibrations of one year or the manufacturers' recommendation, whichever is less, and where applicable is traceable to recognized national standards.

5.2. DECISION RULES

The Decision Rule is based on Simple Acceptance in accordance with ISO Guide 98-4:2012 Clause 8.2. (Measurement uncertainty is not taken into account when stating conformity with a specified requirement.)

5.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	UNCERTAINTY
Radio Frequency (Spectrum Analyzer)	141.2 Hz
Occupied Channel Bandwidth	1.22%
RF output power, conducted	1.3 dB (PK) 0.45 dB (AV)
Power Spectral Density, conducted	2.47 dB
Unwanted Emissions, conducted	1.94 dB
All emissions, radiated	6.01 dB
Conducted Emissions (0.150-30MHz) - LISN	3.40 dB
Temperature	0.57°C
Humidity	3.39%
DC Supply voltages	1.70%
Time	3.39%

Uncertainty figures are valid to a confidence level of 95%.

5.4. SAMPLE CALCULATION

RADIATED EMISSIONS

Where relevant, the following sample calculation is provided:

Field Strength (dBuV/m) = Measured Voltage (dBuV) + Antenna Factor (dB/m) + Cable Loss (dB) – Preamp Gain (dB)
 $36.5 \text{ dBuV} + 18.7 \text{ dB/m} + 0.6 \text{ dB} - 26.9 \text{ dB} = 28.9 \text{ dBuV/m}$

6. EQUIPMENT UNDER TEST

6.1. EUT DESCRIPTION

The EUT is a Wireless Module. This report covers the emissions testing of the BT radio.

6.2. MAXIMUM OUTPUT POWER

The transmitter has a maximum peak conducted output power as follows:

Frequency Range (MHz)	Mode	Output Power (dBm)	Output Power (mW)
2402 - 2480	Basic GFSK	19.66	92.47
2402 - 2480	Enhanced DQPSK	19.59	90.99
2402 - 2480	Enhanced 8PSK	20.19	104.47

Note: GFSK, DQPSK, 8PSK average Power were all investigated, The GFSK and 8PSK power are the worst case. Testing is based on these modes to showing compliance. For average power data please refer to section 9.8.

6.3. DESCRIPTION OF AVAILABLE ANTENNAS

The antenna(s) gain and type, as provided by the manufacturer' are as follows:

Low Gain Antenna:

Chain	Frequency (MHz)	Gain (dBi)	Type
0	2400-2483.5	3.6	PIFA
1	2400-2483.5	3.6	
(Uncorrelated)	2400-2483.5	3.6	
(Correlated)	2400-2483.5	6.61	

Mid Gain Antenna:

Chain	Frequency (MHz)	Gain (dBi)	Type
0	2400-2483.5	4.4	PIFA
1	2400-2483.5	4.4	
(Uncorrelated)	2400-2483.5	4.4	
(Correlated)	2400-2483.5	7.41	

High Gain Antenna:

Chain	Frequency (MHz)	Gain (dBi)	Type
0	2400-2483.5	6.1	PIFA
1	2400-2483.5	6.1	
(Uncorrelated)	2400-2483.5	6.1	
(Correlated)	2400-2483.5	9.11	

Antenna gains for MIMO operations are calculated using the formulae from KDB 662911 D01 Multiple Transmitter Output v02r01 section F. As the two antennas have the same gain equations 2)a)(i) and 2)a)(ii) for correlated and uncorrelated transmissions respectively are used.

Correlated directional gain = $G_{ANT} + 10 \log(N_{ANT})$ dBi, where $N_{ANT} = 2$ for a 2x2 MIMO device

Uncorrelated directional gain = G_{ANT}

6.4. SOFTWARE AND FIRMWARE

The EUT firmware installed during testing was 10.0.22621.1.

The test utility software used during testing was Qualcomm Radio Control Toolkit Version 4.0.118.1.

6.5. WORST-CASE CONFIGURATION AND MODE

All conducted emissions testing was performed as SISO to cover MIMO as a worst case, power-chain, mode. Output power was measured on SISO C0, SISO C1, and MIMO.

Radiated emissions below 1GHz and above 18GHz were performed with the EUT set to transmit at the channel with the highest power for SISO C0, SISO C1 or MIMO, as a worst-case mode.

Band edge was performed with the EUT set to transmit at the highest power on low and high channels. Testing was performed using a conducted restricted band edge setup. A traditional restricted band edge scan (C63.10 Section 11.12.2.2) was ran on chain 0 and chain 1, each operating in SISO mode as a worst-case scenario unless otherwise noted within the report. The data was then summed together accounting for the high gain antenna gain (worst-case). To compare this data to the average limit, a correction factor of -25 dB (see section 9.1) based on the protocol limited correction factor for DH3 modulation. An example band edge scan and has been included for each mode for reference. The summed tabular and plot data has been included for each scan.

NOTE: High gain was used in all the testing as a worst-case since the power for all antenna gains was the same.

Radiated spurious emissions between 1GHz and 18GHz were performed with the EUT set to transmit on low, mid, and high channels at the worst-case power mode for SISO C0 and SISO C1, and at the worst-case average power mode for MIMO. These modes were found to be GFSK for all modes.

The fundamental of the EUT was investigated in three orthogonal orientations X,Y,Z, it was determined that Z orientation was worst-case orientation for SISO C0, SISO C1, and MIMO; therefore, all final radiated testing was performed with the antennas in Z orientation.

Worst-case data rates and packet sizes as determined by power measurements were:

GFSK mode: DH3

QPSK mode : 2-DH1

8PSK mode: 3-DH3

6.6. DESCRIPTION OF TEST SETUP

SUPPORT EQUIPMENT

Support Equipment List				
Description	Manufacturer	Model	Serial Number	FCC ID
NUC	Intel	NuC	BTAN3160022Z/ BTAN322009FE/ BTAN331003QS/ BTAN331002VK	N/A
Intel NUC Charger	Chicony Power Technology	A17-120P2A	0432- 05LT1002333012523	N/A

I/O CABLES

I/O Cable List						
Cable No.	Port	# of Identical Ports	Connector Type	Cable Type	Cable Length (m)	Remarks
1	Ribbon	1	Ribbon	Unshielded	3>	Connects EUT to NUC
2	DC Mains	1	Barrel	Unshielded	3>	Connects NUC to DC Adaptor

TEST SETUP

Test software exercised the radio card.

SETUP DIAGRAMS

Please refer to R15374786-EP1 for setup diagrams

7. TEST AND MEASUREMENT EQUIPMENT

The following test and measurement equipment was utilized for the tests documented in this report:

Test Equipment Used - Wireless Conducted Measurement Equipment

Equipment ID	Description	Manufacturer	Model Number	Last Cal.	Next Cal.

8. MEASUREMENT METHODS

On Time and Duty Cycle: ANSI C63.10-2020 Section 11.6

Occupied BW (20dB): ANSI C63.10-2020 Section 6.9.2

Occupied BW (99%): ANSI C63.10-2020 Section 6.9.3

Carrier Frequency Separation: ANSI C63.10-2020 Section 7.8.2

Number of Hopping Frequencies: ANSI C63.10-2020 Section 7.8.3

Time of Occupancy (Dwell Time): ANSI C63.10-2020 Section 7.8.4

Peak Output Power: ANSI C63.10-2020 Section 7.8.5

Conducted Spurious Emissions: ANSI C63.10-2020 Section 7.8.8

Conducted Band-Edge: ANSI C63.10-2020 Section 6.10.4

Radiated Band-edge: ANSI C63.10-2020 Section 6.10.5

Radiated Spurious Emissions: ANSI C63.10-2020 Sections 6.3 to 6.6

9. ANTENNA PORT TEST RESULTS

9.1. ON TIME AND DUTY CYCLE

LIMITS

None; for reporting purposes only.

PROCEDURE

ANSI C63.10, Section 11.6 : Zero-Span Spectrum Analyzer Method.

Mode	ON Time B (msec)	Period (msec)	Duty Cycle x (linear)	Duty Cycle (%)	1/T Minimum VBW (kHz)
Bluetooth GFSK	1.640	2.500	0.656	65.60	0.610
Bluetooth 8PSK	1.630	2.500	0.652	65.20	0.613

Note: The DCCF used was calculated based on the worst case on-time when the device transmits DH3 packets and operates on 20 channels ($3/1600$ s per hop = 1.875 ms per channel). In this mode, the device will have a maximum of 3 hops on a channel in 100ms or 3×1.875 ms = 5.625 ms on any channel. Therefore, $20\log(5.625 / 100)$ = - 25dB.

9.2. 20 dB BANDWIDTH

LIMITS

None; for reporting purposes only.

TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The RBW is set to $\geq 1\%$ of the 20 dB bandwidth. The VBW is set to $\geq$ RBW. The sweep time is coupled.

RESULTS

9.2.1. BLUETOOTH BASIC DATA RATE GFSK MODULATION

Chain 0

Channel	Frequency (MHz)	20dB Bandwidth (MHz)
Low	2402	0.892
Mid	2441	0.882
High	2480	0.944

Chain 1

Channel	Frequency (MHz)	20dB Bandwidth (MHz)
Low	2402	0.912
Mid	2441	0.932
High	2480	0.938

9.2.2. BLUETOOTH ENHANCED DATA RATE 8PSK MODULATION

Chain 0

Channel	Frequency (MHz)	20dB Bandwidth (MHz)
Low	2402	1.290
Mid	2441	1.294
High	2480	1.293

Chain 1

Channel	Frequency (MHz)	20dB Bandwidth (MHz)
Low	2402	1.287
Mid	2441	1.294
High	2480	1.290

LOW CHANNEL

MID CHANNEL

HIGH CHANNEL

9.3. 99% BANDWIDTH

LIMITS

None; for reporting purposes only.

TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The RBW is set to 1-5% of the 99% bandwidth. The VBW is set to $\geq$ RBW. The sweep time is coupled.

9.3.1. BLUETOOTH BASIC DATA RATE GFSK MODULATION

CHAIN 0

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	0.84470
Mid	2441	0.84021
High	2480	0.84684

CHAIN 1

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	0.85125
Mid	2441	0.84519
High	2480	0.84700

9.3.2. BLUETOOTH ENHANCED DATA RATE 8PSK MODULATION

CHAIN 0

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	1.1890
Mid	2441	1.1924
High	2480	1.1903

CHAIN 1

Channel	Frequency (MHz)	99% Bandwidth (MHz)
Low	2402	1.1897
Mid	2441	1.1894
High	2480	1.1906

9.4. HOPPING FREQUENCY SEPARATION

LIMITS

FCC §15.247 (a) (1)
RSS-247 (5.1) (b)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The RBW is set to 300 kHz and the VBW is set to VBW $\geq$ RBW. The sweep time is coupled.

RESULTS

9.4.1. BLUETOOTH BASIC DATA RATE GFSK MODULATION

Chain 0

Chain 1

9.5. NUMBER OF HOPPING CHANNELS

LIMITS

FCC §15.247 (a) (1) (iii)
RSS-247 (5.1) (d)

Frequency hopping systems in the 2400 – 2483.5 MHz band shall use at least 15 non-overlapping channels.

TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The span is set to cover the entire authorized band, in either a single sweep or in multiple contiguous sweeps. The RBW is set to a maximum of 1 % of the span. The analyzer is set to Max Hold.

RESULTS

9.6. AVERAGE TIME OF OCCUPANCY

LIMITS

FCC §15.247 (a) (1) (iii)
RSS-247 (5.1) (d)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

TEST PROCEDURE

The transmitter output is connected to a spectrum analyzer. The span is set to 0 Hz, centered on a single, selected hopping channel. The width of a single pulse is measured in a fast scan. The number of pulses is measured in a 3.16 second scan, to enable resolution of each occurrence.

The average time of occupancy in the specified 31.6 second period (79 channels * 0.4 s) is equal to $10 * (\# \text{ of pulses in } 3.16 \text{ s}) * \text{ pulse width}$.

For AFH mode, the average time of occupancy in the specified 8 second period (20 channels * 0.4 seconds) is equal to $10 * (\# \text{ of pulses in } 0.8 \text{ s}) * \text{ pulse width}$.

9.7. OUTPUT POWER

LIMITS

§15.247 (b) (1)
RSS-247 (5.4) (b)

The maximum SISO antenna gain is greater than 6 dBi, therefore the limit, 21dBm, is reduced by the amount of the gain >6dB, in this case 0.1 dB. For MIMO, the gain is also >6dBi. Therefore the limit is reduced by the amount of gain >6dBi, 3.11 dB.

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts. The EUT supports AFH thus the limit used is 125 mW for all modes.

TEST PROCEDURE

The transmitter output is connected to a wideband RF power meter.

The cable assembly insertion loss of 11.04 dB for C0 (including 9.72 dB pad and 1.32 dB EUT cable) and 11 dB for C1 (9.68 dB pad and 1.32 dB EUT) was entered as an offset in the power meter

9.10. CONDUCTED SPURIOUS EMISSIONS – RESTRICTED BAND

LIMITS

FCC §15.205 and §15.209
RSS-GEN, Section 8.9 and 8.10.

Frequency Range (MHz)	Field Strength Limit (uV/m) at 3 m	Field Strength Limit (dBuV/m) at 3 m
Above 960	500	54

TEST PROCEDURE

Conducted measurements were made for this test.

For final measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz

Band edge was performed with the EUT set to transmit at the highest power on low and high channels. Testing was performed using a conducted restricted band edge setup as described in ANSI C63.10: 2020 section 7.8.8.4. A traditional restricted band edge scan (C63.10 Section 11.12.2.2) was ran on chain 0 and chain 1, each operating in SISO mode as a worst-case scenario unless otherwise noted within the report. The data was then summed together accounting for the high gain antenna gain (worst-case). To compare this data to the average limit, a correction factor of -25 dB (see section 9.1) based on the protocol limited correction factor for DH3 modulation. An example band edge scan and has been included for each mode for reference. The summed tabular and plot data has been included for each scan. A sample calculation of this test method can be seen below:

Meter Pk Chain 0 Reading = -60 dBm, Meter Pk Chain 1 Reading = -60 dBm. Correlated antenna gain = 9.11 dBi.

$$\text{Pk E-Field} = 10\log[10^{(\text{Pk C0 Reading}/10)} + 10^{(\text{Pk C1 Reading}/10)}] + \text{Correlated Antenna Gain} - 20\log(\text{Measurement distance}) + 104.8$$

$$\text{Pk E-Field} = 10\log[10^{(-60/10)} + 10^{(-60/10)}] + 9.11 - 20\log(3) + 104.8$$

Pk E-Field = 47.38

Average E-Field = Pk E-Field – 25dB
Average E-Field = 22.38

Summed bandedge plots are included for all measurements. Only one representative of the per chain bandedge measurement was included per mode to be representative for the other measurements.

10. UNWANTED EMISSIONS

LIMITS

FCC §15.205 and §15.209

RSS-GEN, Section 8.9 and 8.10.

Frequency Range (MHz)	Field Strength Limit (uV/m) at 3 m	Field Strength Limit (dBuV/m) at 3 m
0.009-0.490	2400/F(kHz) @ 300 m	-
0.490-1.705	24000/F(kHz) @ 30 m	-
1.705 - 30	30 @ 30m	-
30 - 88	100	40
88 - 216	150	43.5
216 - 960	200	46
Above 960	500	54

TEST PROCEDURE

The EUT is placed on a non-conducting table 80 cm above the ground plane for measurement below 1GHz; 1.5 m above the ground plane for measurement above 1GHz. The antenna to EUT distance is 3 meters. The EUT is configured in accordance with ANSI C63.10. The EUT is set to transmit in a continuous mode.

For measurements below 1 GHz the resolution bandwidth is set to 100 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements in the 30-1000MHz range, 9kHz for peak and/or quasi-peak detection measurements in the 0.15-30MHz range and 200Hz for peak and/or quasi-peak detection measurements in the 9 to 150kHz range. Peak detection is used unless otherwise noted as quasi-peak or average (9-90kHz and 110-490kHz).

For pre-scans and final measurements above 1 GHz the resolution bandwidth is set to 1 MHz; the video bandwidth is set to 3 MHz for peak measurements.

The spectrum from 1 GHz to 18 GHz is investigated with the transmitter set to the lowest, middle, and highest channels in each applicable band. Below 1GHz and above 18GHz emissions, the channel with the highest average output power for SISO and MIMO modes were tested

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions.

3D antenna use - For below 30MHz testing, investigation was done on three antenna orientations (parallel, perpendicular, and ground-parallel).

Base on FCC 15.31 (f) (2): measurements may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurements in the near field.

KDB 414788 Open Field Site(OFS) and Chamber Correlation Justification

OFS and chamber correlation testing had been performed and chamber measured test result is the worst case test result.

KDB 558074 D01 15.247 Meas Guidance v05r02

Use of a duty cycle correction factor (DCCF) is permitted for calculating average radiated field strength emission levels for an FHSS device in 15.247. This DCCF can be applied when the field strength limit (e.g., within a Government Restricted band) and the conditions specified in Section 15.35(c) can be satisfied. The average radiated field strength is calculated by subtracting the DCCF from the maximum radiated field strength level as determined through measurement. The maximum radiated field strength level represents the worst-case (maximum amplitude) RMS measurement of the emission(s) during continuous transmission (i.e., not including any time intervals during which the transmitter is off or is transmitting at a reduced power level). It is also acceptable to apply the DCCF to a measurement performed with a peak detector instead of the specified RMS power averaging detector. Note that Section 15.35(c) specifies that the DCCF shall represent the worst-case (greatest duty cycle) over any 100 msec transmission period.

Note: The DCCF used was calculated based on the worst case on-time when the device transmits DH3 (worst-case power mode) packets and operates on 20 channels (3/1600 s per hop = 1.875 ms per channel). In this mode, the device will have a maximum of 3 hops on a channel in 100ms or $3 \times 1.875 \text{ ms} = 5.625 \text{ ms}$ on any channel. Therefore, $20\log(5.625 / 100) = -25\text{dB}$. This value was subtracted from the peak measurement to obtain a calculated average value.

* - indicates frequency in CFR47 Pt 15 / IC RSS-Restricted Band

** - indicates frequency in Taiwan NCC LP0002 Restricted Band

Pk - Peak detector

PK2 - Maximum Peak

NOTE: Average measurement not included in the tabular data since the average measurement is made by applying the protocol limited duty cycle correction factor of -25 dB to the peak measurements.

MID CHANNEL RESULTS
