

Certification of Compliance

CFR 47 Part 15 Subpart B

Test Report File No.	: 05-IST-0185	Date of Issue	: May 12, 2005
Model (s)	: VR2946 (Go-Video)	☐ Basic	☒ Alternated
Kind of Product : DVD Recorder + VCR			
Applicant : Daewoo Electronics Corporation. 543, Dangjung-Dong, Kunpo-City, Kyounggi-DO, Korea			
Manufacturer : Daewoo Electronics Corporation. 295, Gondan-dong, Kumi-city, Kyungsangbuk-do, Korea.

- Investigations requested : Measurement to the relevant clauses of F.C.C rules and regulations Part 15 Subpart B - Unintentional Radiations
- The test report with appendix consists of 31 pages.
- The test result only responds to the tested sample.
- It is not allowed to copy this report even partly without the allowance of IST EMC Laboratory.
- This equipment as for has been shown to be capable of continued compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in ANSI C63.4 2003.

DESCRIPTION OF TEST

Radiated Emissions:

The measurement was performed over the frequency range of 30MHz to 1GHz using antenna as the input transducer to a Spectrum analyzer or a Field Intensity Meter. The measurement was made with the detector set for "quasi-peak" within a bandwidth of 120KHz.

- Procedure of Test

Preliminary measurements were made at 3 meter using bi-conical and log-periodic antennas, and spectrum analyzer to determine the frequency producing the max. emission in anechoic chamber. Appropriate precaution was taken to ensure that all emission from the EUT were maximized and investigated. The system configuration, mode of operation, turn table azimuth and height with respect to the antenna were noted for each frequency found. The spectrum was scanned from 40MHz to 300MHz using S/B bi-conical antenna and 300 to 1000MHz using S/B log-periodic antenna. Above 1GHz, linearly polarized double ridge horn antennas were used. Final measurements were made at open site with 3-meters test distance using S/B bi-log antenna or horn antenna. The OATS have been verified in regular for its normalized site attenuations. The test equipment was placed on a wooden table. Sufficient time for the EUT, peripheral equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined by manual. The detector function was set to CISPR quasi-peak mode and the bandwidth of the receiver was set to 120kHz or 1MHz depending on the frequency of type of signal. The EUT, peripheral equipment and interconnecting cables were re-configured to the set-up producing the max. emission for the frequency and were placed on top of a 0.8-meter high nonmetallic 1 x 1.5 meter table. The EUT, peripheral equipment, and interconnecting cables were re-arranged and manipulated to maximize each emission. The turntable containing the system was rotated; the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission. Each emission was maximized by: varying the mode of operation to the EUT and/or peripheral equipment and changing the polarity of the antenna, whichever determined the worst-case emission.

.

SUMMARY

■ Conducted Emission

The requirements are

● MET ○ Not MET

Minimum limit margin

3.1dB at 4.071MHz

Maximum limit exceeding

**Remarks : With Neutral phase for average detect mode
(RF Receiving + DVD REC , LG Tuner)**

■ Radiated Emission

The requirements are

● MET ○ Not MET

Minimum limit margin

3.1dB at 196.6MHz

Maximum limit exceeding

Remarks : At RF Receiving + DVD REC , LG Tuner

☐ Output Signal Level Measurements

The requirements are

○ MET

○ Not MET
