Report Of Measurement

Includes sample calculations, block diagrams, photographs of test configurations and properly signed and dated report.

TEST RESULT SUMMARY

FCC PART 15 SUBPART C Section 15.209

MANUFACTURER'S NAME	Destron-Fearing Corp
NAME OF EQUIPMENT	Transmitter for Portable Transceiver
MODEL NUMBER	2001F
MANUFACTURER'S ADDRESS	490 Villaume Avenue South St Paul MN 55075-2445
TEST REPORT NUMBER	W9069
TEST DATE	28 January 1999

According to testing performed at TÜV Product Service Inc, the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in FCC Part 15.

It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics. Any modifications necessary for compliance made during testing on the above mentioned date(s) must be implemented in all production units for compliance to be maintained.

TÜV Product Service Inc, as an independent testing laboratory, declares that the equipment tested as specified above conforms to the requirements of FCC Part 15.

Date: 09 February 1999

TÜV Product Service Inc is a subcontractor to TÜV Product Service, GmbH according to the principles outlined in ISO/IEC Guide 25 and EN 45001.

TÜV Product Service Inc reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. TÜV Product Service Inc shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV Product Service Inc issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval. This report shall not be used by the client to claim product endorsement by NVLAP or any agency of the US government.

TÜV Product Service Inc and its professional staff hold government and professional organization certifications and are members of AAMI, ACIL, AEA, ANSI, IEEE, NVLAP, and VCCI

Emission Test Results:**Conducted emissions 10/150 kHz - 30 MHz**

The requirements are ☐ - MET ☐ - NOT MET

Minimum limit margin _____ dB at _____ MHz

Maximum limit exceeding _____ dB at _____ MHz

Remarks: _____

Radiated emissions (magnetic field) 10 kHz - 30 MHz

The requirements are ☒ - MET ☐ - NOT MET

Minimum limit margin for fundamental _____ 0 dB at 134.2 kHz

Minimum limit margin for spurious _____ 6 dB at 671.0 kHz

Remarks: The level at 134.2 kHz is 25 dBuV/m (17.7 uV/m) at a distance of 300 meters based on the measured extrapolation factor of 51 dB/decade. A level of 127 dBuV/m was measured at a 3 meter distance, and a level of 76 dBuV/m was measured at a 30 meter distance (127-76=51). The limit is 2400/134.2, or 25 dBuV/m (17.8 uV/m) at 300 meters.

The level at 671.0 kHz is 65 dBuV/m (1778 uV/m) at a distance of 3 meters. This would be 6 dB below the limit using the standard 40 dB/decade extrapolation factor (17 dB below the limit using the 51 dB/decade measured for the fundamental). The limit is 24000/670, or 31 dBuV/m (35.7 uV/m) at 30 meters, 71 dBuV/m (3548 uV/m) at 3 meters.

Radiated emissions (electric field) 30 MHz - 1000 MHz

The requirements are ☐ - MET ☐ - NOT MET

Minimum limit margin for fundamental _____ dB at _____ MHz

Minimum limit margin for spurious _____ dB at _____ MHz

Remarks: _____

Interference Power at the mains and interface cables 30 MHz - 300 MHz

The requirements are ☐ - MET ☐ - NOT MET

Minimum limit margin _____ dB at _____ MHz

Maximum limit exceeding _____ dB at _____ MHz

Remarks: _____

Equivalent Radiated emissions 1 GHz - 3.14 GHz

The requirements are ☐ - MET ☐ - NOT MET

Minimum limit margin _____ dB at _____ MHz

Maximum limit exceeding _____ dB at _____ MHz

Remarks: _____

DEVIATIONS FROM STANDARD:

None.

GENERAL REMARKS:

The digital device portion of the equipment under test was tested and found to be compliant with the FCC Part 15 Subpart B Class A requirements (Test Report #W9069.1).

SUMMARY:

The requirements according to the technical regulations are

■ - met

□ - not met.

The device under test does

■ - fulfill the general approval requirements mentioned on page 3.

□ - not fulfill the general approval requirements mentioned on page 3.

Testing Start Date: 28 January 1999

Testing End Date: 28 January 1999

MEASUREMENT PROTOCOL

GENERAL INFORMATION

Measurement Uncertainty

The test system for conducted emissions is defined as the LISN, tuned receiver or spectrum analyzer, and coaxial cable. The test system for radiated emissions is defined as the antenna, the pre-amplifier, the spectrum analyzer and the coaxial cable. These test systems have a measurement uncertainty of ± 4.5 dB. The equipment comprising the test systems are calibrated on an annual basis.

Justification

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral into it's characteristic impedance or left unterminated. When appropriate, the cables are manually manipulated with respect to each other to obtain maximum emissions from the unit.

CONDUCTED EMISSIONS

The final level, expressed in $\text{dB}\mu\text{V}$, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the FCC limit.

To convert between $\text{dB}\mu\text{V}$ and μV , the following conversions apply:

$$\text{dB}\mu\text{V} = 20(\log \mu\text{V})$$

$$\mu\text{V} = \text{Inverse log}(\text{dB}\mu\text{V}/20)$$

RADIATED EMISSIONS

The final level, expressed in $\text{dB}\mu\text{V}/\text{m}$, is arrived at by taking the reading from the spectrum analyzer (Level $\text{dB}\mu\text{V}$) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has the FCC limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets in Attachment B. The amplifier gain is automatically accounted for by using an analyzer offset.

Example:

Frequency (MHz)	Level ($\text{dB}\mu\text{V}$)	+	Factor & Cable (dB)	=	Final ($\text{dB}\mu\text{V}/\text{m}$)	-	FCC B Limit ($\text{dB}\mu\text{V}/\text{m}$)	=	Delta FCC B (dB)
32.21	13.9	+	16.3	=	30.2	-	40.0	=	-9.8

DETAILS OF TEST PROCEDURES**General Standard Information**

The test methods used comply with ANSI C63.4-1992 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

Conducted Emissions

Conducted emissions on the 60 Hz power interface of the EUT are measured in the frequency range of 450 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection, and a Line Impedance Stabilization Network (LISN), with 50 Ω /50 μ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. In some cases, a pre-scan using a spectrum analyzer is initially performed on the units comprising the system under test to locate the highest emissions. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are re-measured using a tuned receiver or spectrum analyzer with quasi-peak and average detection and recorded on the data sheets.

Radiated Emissions

Radiated emissions from the EUT are measured in the frequency range of .009 to 30 MHz using a receiver, which has CISPR characteristic bandwidth and quasi-peak/average detection. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80 centimeters above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna is positioned 3, 10 and 30 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is positioned with its plane vertical/horizontal, and rotated about its vertical/horizontal axis for maximum response at each azimuth about the EUT. The center of the loop is 1 meter above the ground plane. Intentional radiators are rotated through three orthogonal axes to determine the attitude that maximizes the emissions.
