4. Test Set-up and Operation Modes

4.1 Principle of Configuration Selection

The equipment under test (EUT) was configured to measure its maximum emission level. The test modes were adapted accordingly in reference to the instructions for use.

4.2 Test Operation and Test Software

Setup for testing: Test samples are provided with a Data interface which makes it possible to control them through a test software installed on a notebook computer.

Both alarming and non-alarming have been evaluated, only the worst case situation is shown.

4.3 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

Kind of Equipment	Manufacturer	Model Name	S/N
--	--	--	--

4.4 Countermeasures to achieve EMC Compliance

The test sample which has been tested contained the noise suppression parts as described in the Constructional Data Form or the Technical Construction File. No additional measures were employed to achieve compliance.

5. Test Results

5.1 Transmitter Requirement & Test Suites

5.1.1 Antenna Requirement

RESULT:**Passed**

Standard : Part 15.203 and RSS-Gen 7.1.4
Requirement : use of approved antennas only

The antenna and the transmitter are one assembly with no possibility of replacement with a non-approved antenna by a normal the end-user. Therefore, the EUT is considered to comply with this provision.

Refer to EUT photo for details.

 Remark: For details refer to Appendix D

5.1.3 Duty Cycle Correction Factor

RESULT:

Not tested

For test records, please refer to
test report No. 14060504 prepared by TÜV Rheinland Nederland B.V.

These are the results found in that test report:

64 peaks were observed in a 100 ms interval. Each peak was measured to have a duration of 1.094 ms. This yields a total on-time of 70.02 ms in a 100 ms interval. Using the formula Average factor (dB) = $20 \cdot \text{LOG}(70.02\text{ms} / 100\text{ms})$, the duty cycle average factor is therefore **-3.10 dB**.

Plot 3a and 3b below show the RF On/Off characteristics of the EUT's emissions. From these characteristics a correction factor is calculated that is required to derive Average values from the measured peak values of the emissions.
