3. General Product Information

3.1 Product Function and Intended Use

The EUT is a device for parking occupancy detection of individual spaces through identification of the car. It can communicate with a Datacollector through a wireless interface. For details refer to the User Guide, Data Sheet and Circuit Diagram.

The device tested for all item (SENSIT IR US) is intended to be, for the lower part, buried into a hole in the ground surface.

There is a second version which is intended to be completely buried into a hole in the ground surface so that the upper surface sensor is "flush" with the ground surface. (SENSIT FLUSH MOUNT US).

All tests have been carried out with the SENSIT IR US and radiated emissions were carried out on the SENSIT FLUSH MOUNT US.

5. Test Results

5.1 Transmitter Requirement & Test Suites

5.1.1 Antenna Requirement

RESULT:**Passed**

Test standard	:	FCC Part 15.247(b)(4), Part 15.203 and RSS-Gen 8.3
Requirement	:	use of approved antennas only

According to the manufacturer declaration, the EUT has an antenna with a directional gain of -2 dBi. The antenna is a top-loaded whip antenna with no possibility of replacement with a non-approved antenna by the end-user. Therefore, the EUT is considered to comply with this provision.

Refer to EUT photo for details.

5.1.2 Peak Output Power

RESULT:**Passed**

Test standard : FCC Part 15.247(b)(1),
RSS-247 5.4(2)

Basic standard : ANSI C63.10:2013
LP0002(2011) Appendix II

Kind of test site : Semi-Anechoic Chamber

Test setup

Test Channel : Low/ Middle/ High

Operation Mode : A

Ambient temperature : 20-24 °C

Relative humidity : 50-65 %

Atmospheric pressure : 100-103 kPa

Table 6: Test result of Peak Output

Channel	Channel Frequency	Peak Output Power		Limit
	(MHz)	(dBm)	(W)	(W)
Low Channel	902.4 MHz	5.47	0.00352	1
Middle Channel	915 MHz	5.36	0.00344	1
High Channel	927.6 MHz	4.83	0.00304	1

Test procedure:

Since the EUT has no connector port available for conducted measurements the test results are obtained by radiated measurement using the setup for radiated emissions. From the measured radiated field strength at a distance of 3m and the antenna gain **G** (as declared by the applicant) the peak conducted output power value is calculated. This value is calculated using the formula:

E is the measured maximum fundamental field strength in V/m

-> -21.3 dBV/m = 0.086 V/m @ 902.4 MHz

-> -21.4 dBV/m = 0.085 V/m @ 915 MHz

-> -21.9 dBV/m = 0.08 V/m @ 927.6 MHz

G is the numeric gain of the transmitting antenna with reference to an isotropic radiator.

-> -2 dBi => 0.631

d is the distance in meters from which the field strength was measured.

-> 3m

P is the power in watts:

$$P = \frac{(E \cdot d)^2}{30G}$$

@ 902.4 MHz $SQ(0.086^2) / 18.93 = 0.00352 \text{ W} = 5.47 \text{ dBm}$

@ 915 MHz $SQ(0.085^2) / 18.93 = 0.00344 \text{ W} = 5.36 \text{ dBm}$

@ 927.6 MHz $SQ(0.08^2) / 18.93 = 0.00304 \text{ W} = 4.83 \text{ dBm}$

For details refer to Appendix D.
