Accredited testing laboratory

DAR-registration number : TTI-P-G 166/98-20

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%

1.3 Details of applicant

Name : Technology & Quality Management Division,
Toshiba Corporation, Digital Media Network Company
Street : 1-1-1 Shibaura
City : Minarto-ku, Tokyo 198-8001
Country : Japan
Telephone: +81 (3) 3457 2565
Telefax : +81 (3) 5444 9404
Contact : Mr. Hideo Abe
Telephone: +81 (3) 3457 2565

1.4 Application details

Date of receipt of application : 23.04.01

Date of receipt of test item : 23.04.01

Date of test : 24.04. – 26.04.01

1.5 Test item

Type of equipment : **Bluetooth module for integration into PC`s**

Type designation :

Manufacturer : - applicant -

Street :

City :

Country :

Serial number :

Additional informations: :

Frequency : 2402 – 2480 MHz

Type of modulation : 1M00FXD (FHSS) Ch.Sep. : 1 MHz

Number of channels : 79

Antenna : integral antenna

Power supply : 5.0 DC powered by USB port

Output power cond. : 1 mW

Type of equipment : Class B

Temperature range : +5°C - +35°C

1.6 Test standards: FCC Part 15 §15.247

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%

2 Technical test

2.1 Summary of test results

For the measurements, the module was powered by a Toshiba laptop Satellite 4600 Pro or an external PCB test board.

The radiated measurements were performed with the antenna positioned outside and inside the laptop.

The radiated measurements were performed horizontal, vertical results are about 6 dB lower over the complete frequency range.

The antenna gain measurement was performed by the difference between conducted and radiated output measurement.

The conducted power measurement was performed by a temporary added coax adapter.

All measurement settings are according to FCC 15.35, 15.205, 15.209, 15.247 and the „Measurement guidelines for FHSS systems“.

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

The product fullfills also the requirements for CANADA RSS-210.

TEST REPORT

Testreport no. : 2-2509-E/01

Equipment under test : Bluetooth module**Ambient temperature : 23° C****Relative humidity : 47%****TEST REPORT REFERENCE****LIST OF MEASUREMENTS**

Paragraph	PARAMETER TO BE MEASURED	PAGE
TRANSMITTER PARAMETERS		
§ 15.204	Antenna gain	7
§ 15.247 (a)	Carrier frequency separation	8
§ 15.247 (a)	Number of hopping channels	9
§ 15.247 (a)	Time of occupancy (dwell time)	13
§ 15.247 (a)(1)	Spectrum bandwidth of a FHSS System	20
§ 15.247 (b)(2)	Maximum peak output power	24
§15.247	Band edge compliance	29
§ 15.247 (c)(1)	Emission limitations	33
§ 15.107/207	Low frequency emissions	59
RECEIVER PARAMETERS		
§ 15.209	Spurious radiations - Radiated	61
Test equipment listing		68
Photographs of the equipment		70

Equipment under test : Bluetooth module**Ambient temperature : 23° C****Relative humidity : 47%****Antenna Gain****SUBCLAUSE § 15.204**

The antenna gain of the complete system is calculated by the difference of conducted power of the module and the radiated power in EIRP.

	low channel	mid channel	high channel
Conducted power	-2.99 dBm	-3.19 dBm	-2.7dBm
Radiated power (antenna outside)	-1.94 dBm	-2.07 dBm	-1.61 dBm
Gain	+1.05 dBm	+1.12 dBm	+1.09 dBm
Radiated power (antenna inside laptop)	-6.2 dBm	-6.3 dBm	-6.5 dBm
Gain	-3.21 dB	-3.11 dB	-3.8 dB

**The calculated antenna gain is between –3.11 and –3.8 dB for the build-in antenna
And between +1.05 and +1.12 dB for the stand-alone antenna outside housing.**

When the module and the dedicated antenna are met in a computer, the radiated power is lower because of metallic parts near the antennas.

Time of occupancy (dwell time) for DH1

§15.247(a)

The system makes worst case 1600 hops per second or 1 time slot has a length of 625µs with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So you have each channel 10.13 times per second and so for 30 seconds you have 303.9 times of appearance .

Each tx-time per appearance is 475 µs.

So we have $303.9 * 420 \mu s = 127.6ms$ per 30 seconds.

Date: 31.MAY.2001 15:04:37

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%

Time of occupancy (dwell time) for DH3

§15.247(a)

A DH3 Packets need 3 time slots for transmit and 1 for receicing, then the system makes worst case 400 hops per second with 79 channels. So you have each channel 5.1 times per second and so for 30 seconds you have 153 times of appearance .

Each tx-time per appearance is 1.73 ms.

So we have 153 * 1.68 ms = 257.04 ms per 30 seconds.

Date: 31.MAY.2001 15:06:44

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%

Time of occupancy (dwell time) for DH5

§15.247(a)

At DH5 Packets you need 5 time slots for transmit and 1 for receicing, then the system makes worst case 266,7 hops per second with 79 channels. So you have each channel 3.36 times per second and so for 30 seconds you have 100,8 times of appearance .

Each tx-time per appearance is 3.7 ms.

So we have $100,8 * 3.76\text{ms} = 379\text{ ms}$ per 30 seconds.

Date: 31.MAY.2001 15:09:07

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%

Time of occupancy (dwell time) for page mode

§15.247(a)

At paging mode the system makes first hopping with 16 channels. One sequence(called train A) lasts 10 ms. Every 1.28s frequencies change and a second train A starts with different frequencies. After max 7*1.28 s 16 new more distance frequencies (Train B) are used.

So we have in the worst case (same frequency is in every train) the following time scedule.

First: 7*128*10ms. For the next 7 seconds train B with other frequencies.

Then train A and B changes frequently.

⇒ so we have 7*112*180µs, then 8.96 s other frequencies, then again 7*112*180µs

⇒ together in 30 s maximal 2 sequences => maximal 0,282 s per 30 second period.

Page mode (TX-on time)

Center 2.441 GHz 1.2 ms/

Date: 31.MAY.2001 15:29:58

The figure is a spectrum plot with a blue trace showing signal amplitude in dBm versus frequency. The plot has a grid with major lines every 10 dB on the vertical axis (from -80 to 10) and every 10 MHz on the horizontal axis. A red vertical line is positioned at the center frequency of 2.441 GHz. The signal trace shows a series of peaks and valleys, with the highest peak reaching approximately 0.54 dBm. Annotations include a green '1MAX' label near the top left, a red 'TR' label near the bottom left, and several cyan labels on the right side indicating specific signal characteristics: '1 [T1] 0.54 dBm', '-48.1096192 μs', '1 [T1] 0.02 dB', and '10.017737 ms'. The top of the plot contains various technical parameters: 'Ref Lvl -0.02 dB', '13 dBm', 'Delta 1 [T1] 10.017737 ms', 'RBW 1 MHz', 'RF Att 20 dB', 'VBW 3 MHz', 'SWT 12 ms', and 'Unit dBm'. The bottom of the plot shows the center frequency 'Center 2.441 GHz' and a scale '1.2 ms/'. The date and time 'Date: 31.MAY.2001 15:29:58' are displayed at the very bottom.

§ 15.247 (c) (1)

high channel up to 12 GHz

This is only a scan.

Measurements were performed by main with 100/120 kHz BW for CISPR Quasipeak below 1 GHz, with 1MHz RBW/VBW at average and peak over 1 GHz.

Equipment under test : Bluetooth module

Ambient temperature : 23° C

Relative humidity : 47%
