The Bluetooth Transmitter Module performance, with respect to FCC Part 15 Subpart C requirements, is documented by CCS Report 02U1501-1 dated October 3, 2002, FCC ID: CJ6UPA3232BT, Certification Pending.

The WLAN Transmitter Module has an existing limited module approval under FCC ID CJ6PA3171WL.

The performance of the Touch Screen Platform system, with respect to AC Mains Line Conducted emissions and radiated emissions as a Digital Device, is documented by Toshiba Document Number OFA-H3355 Rev. A dated October 3, 2002, FCC ID: CJ6UPP350SY, Certification Pending.

3. DESCRIPTION OF EUT AND CLASS II PERMISSIVE CHANGE

3.1.1. EUT DESCRIPTION

The PA3171WL is a wireless Direct Sequence Spread Spectrum WLAN transceiver module that operates from 2412 – 2462 MHz. This unit provides a maximum power output of +19.29 dBm (85 mW) and is connected to two identical internal film antennas. One antenna (Main) is used for transmit and both antennas (Main plus Aux) are used for dual diversity receive.

According to the original FCC Grant of Equipment Authorization, this module may only be used in Toshiba laptops.

3.1.2. DESCRIPTION OF CLASS II PERMISSIVE CHANGE

This module was originally certified with the Dual Film antenna set. Each identical antenna in this set has a 0.9 dBi gain.

The proposed change is to add the Wide Dual Film antenna set and to add co-location with the CSR Bluetooth transceiver module. Each identical antenna in this alternate set has a 1.26 dBi gain

The CSR Bluetooth module is a wireless Frequency Hopping Spread Spectrum transceiver that operates from 2402 – 2480 MHz. This unit provides a maximum power output of +1.4 dBm (1.38 mW) and is connected to an internal film antenna with a 1.22 dBi gain (Single Film).

The Toshiba Portege 3500 is a Touch Screen Platform with two transceivers installed. One is the CSR Bluetooth module and one is the WLAN module.

Above 960	500	54

8. TEST SETUP, PROCEDURE AND RESULT

8.1. UNDESIRABLE EMISSIONS – RADIATED MEASUREMENTS

TEST SETUP

The EUT is placed on the wooden table. The antenna to EUT distance is 3 meters for measurements below 1 GHz and 1 meter for measurements above 1 GHz. The EUT is configured in accordance with Section 8 of ANSI C63.4/1992.

The EUT is set to transmit in a continuous mode.

TEST PROCEDURE

For measurements below 1 GHz the resolution bandwidth is set to 100 kHz for peak detection measurements or 120 kHz for quasi-peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

For measurements above 1 GHz within restricted bands, the resolution bandwidth is set to 1 MHz, then the video bandwidth is set to 1 MHz for peak measurements and 10 Hz for average measurements.

The spectrum from 30 MHz to 26 GHz is investigated.

The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The frequency span is set small enough to easily differentiate between broadcast stations, intermittent ambient signals and EUT emissions. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the suspected signal. Measurements were made with the antenna polarized in both the vertical and the horizontal positions.

TEST PROCEDURE FOR CO-LOCATED TRANSMITTERS

Each transmitter is operated individually, in a continuously transmitting mode, on their respective Low, Middle, and High channels, and the spurious emissions are measured.

Pretesting of all channel combinations with both transmitters operating simultaneously is performed to determine the worst case simultaneous configuration.

The results of final testing of the worst case simultaneous configuration is presented in this report.
