

RF TEST REPORT

Test item : 4G LTE CPE
Model No. : C773
Order No. : DEMC1306-02017
Date of receipt : 2013-06-26
Test duration : 2013-08-26 ~ 2013-09-09
Date of issue : 2013-09-13
Use of report : FCCOriginal Grant

Applicant : BIT & PULSE CO., LTD
2F Baegang B/D, 666-14 Sinsa-dong, Gangnam-gu, Seoul 135-897, Korea

Test laboratory : Digital EMC Co., Ltd.
683-3, Yubang-Dong, Cheoin-Gu, Yongin-Si, Gyeonggi-Do, 449-080, Korea

Test specification : §22(H), §24(E)
Test environment : See appended test report
Test result : ☒ Pass ☐ Fail

The test results presented in this test report are limited only to the sample supplied by applicant and the use of this test report is inhibited other than its purpose. This test report shall not be reproduced except in full, without the written approval of DIGITAL EMC CO., LTD.

1. GENERAL INFORMATION

Applicant Name: BIT & PULSE CO., LTD

Address: 2F Baegang B/D, 666-14 Sinsa-dong, Gangnam-gu, Seoul 135-897, Korea

FCC ID : CO3BPLC773

FCC Classification : Licensed Non-Broadcast Station Transmitter (TNB)

EUT Type : 4G LTE CPE

Model Name : C773

Add Model Name : N/A

Supplying power : Switching Adaptor
- MODEL: FJ-SW1202000U
- INPUT : 100-240V 50/60Hz 0.6Amax
- OUTPUT : 12V & 2000mA

Antenna Information : Cellular & PCS band for CDMA 1x : Internal Antenna
Cellular & PCS band for CDMA 1x EVDO(Rev. A) : External Antenna

Tx Frequency : Cellular band CDMA 1x 824.70MHz ~ 848.31 MHz
Cellular band CDMA 1x EVDO(Rev. A): 824.70 MHz ~ 848.31 MHz
PCS band CDMA 1x 1851.25 MHz ~ 1908.75 MHz
PCS band CDMA 1x EVDO(Rev. A): 1851.25 MHz ~ 1908.75 MHz

Rx Frequency : Cellular band CDMA 1x 869.70 ~ 893.31 MHz
Cellular band CDMA 1x EVDO(Rev. A): 869.70 ~ 893.31 MHz
PCS band CDMA 1x 1931.25 MHz ~ 1988.75 MHz
PCS band CDMA 1x EVDO(Rev. A): 1931.25 MHz ~ 1988.75 MHz

Max. RF Output Power : Cellular band CDMA 1x 0.292 W ERP(24.66 dBm)
Cellular band CDMA 1x EVDO(Rev. A): 0.221 W ERP(23.44 dBm)
PCS band CDMA 1x 0.327 W EIRP(25.15 dBm)
PCS band CDMA 1x EVDO(Rev. A): 0.226 W EIRP(23.54 dBm)

Emission Designator(s) : Cellular band CDMA 1x 1M28F9W
Cellular band CDMA 1x EVDO(Rev. A): 1M28F9W
PCS band CDMA 1x 1M28F9W
PCS band CDMA 1x EVDO(Rev. A): 1M29F9W

2. INTRODUCTION

2.1. EUT DESCRIPTION

The Equipment Under Test(EUT) supports CDMA and EVDO(Rev. A) of Cellular/PCS bands and LTE(Band 4, 13, 25) with 2.4GHz WLAN. The EUT has below 3 transceivers.

1. CDMA 1x
2. LTE/CDMA 1x EVDO(Rev. A)
3. 2.4GHz WLAN

2.2. MEASURING INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment, which is traceable to recognized national standards.

2.3. TEST FACILITY

The 3&10M test site and conducted measurement facility used to collect the radiated data are located at the 683-3, Yubang-Dong, Yongin-Si, Gyunggi-Do, 449-080, South Korea. The site is constructed in conformance with the requirements.

- 3 & 10M test site registration Number: 678747

3. DESCRIPTION OF TESTS

3.1 ERP&EIRP

(Effective Radiated Power & Equivalent Isotropic Radiated Power)

Test Set-up

Test Procedure

These measurements were performed at 3 & 10m test site. The equipment under test is placed on a wooden turntable 0.8 meters above the ground plane and 3-meters from the receive antenna. The receive antenna height and turntable rotations were adjusted for the highest reading on the receive spectrum analyzer.

A half-wave dipole was substituted in place of the EUT. This dipole antenna was driven by a signal generator and the level of the signal generator was adjusted to obtain the same receive spectrum analyzer reading. The conducted power at the terminal of the substitute antenna is measured. The ERP/EIRP is calculated using the following formula,

$$\text{ERP/EIRP} = \text{The conducted power at the substitute antenna's terminal} + \text{substitute antenna gain}$$

For readings above 1GHz, the above procedure is repeated using horn antennas and the difference between the gain of the horn and an isotropic antenna are taken into consideration.

3.2 PEAK TO AVERAGE RATIO

Test set-up

Test Procedure

A peak to average ratio measurement is performed at the conducted port of the EUT.

The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) measurement profile is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth. The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The present of time the signal spends at or above the level defines the probability for that particular power level.

1. Set resolution/measurement bandwidth $\geq$ signal's occupied bandwidth
2. Set the number of counts to a value that stabilizes the measured CCDF curve
3. Set the measurement interval as follows:
 - 1) For continuous transmissions, set to 1 ms
 - 2) For burst transmissions, employ an external trigger that is synchronized with the EUT burst timing sequence, or use the internal burst trigger with a trigger level that allows the burst to stabilize and set the measurement interval to a time that is less than or equal to the burst duration.
4. Record the maximum PAPR level associated with a probability of 0.1%

3.3 OCCUPIED BANDWIDTH.

Test set-up

Offset value information

CDMA 1x

Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)
824.70	6.92	1851.25	7.35
836.52	7.01	1880.00	7.39
848.31	7.05	1908.75	7.43

Note. 1: The offset values from EUT to Spectrum analyzer were measured and used for test.
Offset value = Splitter + Cables

CDMA 1x EVDO(Rcv. A)

Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)
824.70	6.22	1851.25	6.65
836.52	6.31	1880.00	6.69
848.31	6.35	1908.75	6.73

Note. 1: The offset values from EUT to Spectrum analyzer were measured and used for test.
Offset value = Splitter + Cables

Test Procedure

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power of a given emission.

1. The signal analyzer's automatic bandwidth measurement capability was used to perform the 99% occupied bandwidth and the 26dB bandwidth. The bandwidth measurement was not influenced by any intermediate power nulls in the fundamental emission.
2. RBW = 1 ~ 5% of the expected OBW & VBW ≥ 3 X RBW
3. Detector = Peak
4. Trance mode = Max hold
5. Sweep = Auto couple
6. The trace was allowed to stabilize
7. If necessary, step 2 ~ 7 were repeated after changing the RBW such that it would be within 1 ~ 5% of the 99% occupied bandwidth observed in step 7.

3.4 SPURIOUS AND HARMONIC EMISSIONS AT ANTENNA TERMINAL.

Test set-up

Offset value information

CDMA 1x

Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)
823.0	6.90	1849.0	7.34	5000.0	8.11
850.0	7.06	1911.0	7.55	20000.0	9.42

Note. 1: The offset values from EUT to Spectrum analyzer were measured and used for test.
Offset value = Cable A + Splitter + Cable B + Cable C

CDMA 1x EVDO(Rcv. A)

Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)	Frequency (MHz)	Offset Value (dB)
823.0	6.20	1849.0	6.64	5000.0	7.41
850.0	6.36	1911.0	6.85	20000.0	8.72

Note. 1: The offset values from EUT to Spectrum analyzer were measured and used for test.
Offset value = Cable A + Splitter + Cable B

Test Procedure

The level of the carrier and the various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer.

The EUT was setup to maximum output power at its lowest channel. The spectrum is scanned from the lowest frequency generated in the equipment up to a frequency including its 10th harmonic.

1. RBW = 1MHz & VBW ≥ 3MHz
2. Detector = Positive peak
3. Trace mode = Max hold
4. Sweep time = Auto
5. The trace was allowed to stabilize

The highest, lowest and a middle channel were tested for out of band measurements.

The minimum permissible attenuation level of any spurious emission is $43 + \log_{10}(P_{\text{Watts}})$, where P is the transmitter power in Watts.

Note 1: In the 1MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least 1 percent of the emission bandwidth of the fundamental emission of the transmitter was employed to measure the out of band Emissions.

Note 2: Compliance with the applicable limits is based on the use of measurement instrumentation employing a RBW of 100 KHz or greater for Part 22 and 1 MHz or greater for Part 24.

3.5 RADIATED SPURIOUS EMISSIONS

Test Set-up

Test Procedure

This measurement was performed at 3-meter test range. The equipment under test is placed on a wooden turntable 0.8-meters above the ground plane and 3-meters from the receive antenna.

The receive antenna height and turntable rotations were adjusted for the highest reading on the receive spectrum analyzer.

For radiated power measurements below 1GHz, a half-wave dipole was substituted in place of the EUT. This dipole antenna was driven by a signal generator and the level of the signal generator was adjusted to obtain the same spectrum analyzer reading.

For radiated power measurements above 1GHz, a Horn antenna was substituted in place of the EUT. This Horn antenna was driven by a signal generator and the level of the signal generator was adjusted to obtain the same spectrum analyzer reading. The difference between the gain of the horn and an isotropic antenna are taken into consideration.

This measurement was performed with the EUT oriented in 3 orthogonal axis.

3.6 FREQUENCY STABILITY / VARIATION OF AMBIENT TEMPERATURE

Test Set-up

Test Procedure

The frequency stability of the transmitter is measured by:

- a.) **Temperature:** The temperature is varied from - 30 °C to + 50 °C using an environmental chamber.
- b.) **Primary Supply Voltage:** The primary supply voltage is varied from battery end point to 115 % of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied.

Specification - the frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within $\pm 0.000\ 25\ \%$ ($\pm 2.5\ \text{ppm}$) of the center frequency.

Time Period and Procedure:

1. The carrier frequency of the transmitter is measured at room temperature. (25°C to provide a reference).
2. The equipment is turned on in a "standby" condition for one minute before applying power to the transmitter. Measurement of the carrier frequency of the transmitter is made within one minute after applying power to the transmitter.
3. Frequency measurements are made at 10°C intervals ranging from -30°C to +50°C. A period of at least one half-hour is provided to allow stabilization of the equipment at each temperature level.

NOTES:

Effective Radiated Power Output Measurements by Substitution Method according to ANSI/TIA/EIA-603-C-2004, Aug. 17, 2004:

The EUT is placed on a wooden turn table 3-meters from the receive antenna. The receive antenna height and turntable rotation is adjusted for the highest reading on the receive spectrum analyzer. For CDMA signals, a peak detector is used, with RBW = VBW = 3 MHz. For WCDMA signals, a peak detector is used, with RBW = VBW = 5MHz. For AMPS, GSM, and TDMA signals, a peak detector is used, with RBW = VBW = 1 MHz.

A half-wave dipole is substituted in place of the EUT. This dipole antenna is driven by a signal generator and the level of the signal generator is adjusted to obtain the same receive spectrum analyzer reading. The conducted power at the terminals of the dipole is measured. The ERP is recorded.

This EUT was tested under all configurations and the highest power is reported in GSM mode and WCDMA mode with HSDPA inactive at 12.2 kbps RMC and TPC bits set to "1" and in GSM mode using a Power Control Level of "0" in PCS Band and "5" in the Cellular Band. We have done x, y, z planes in EUT and horizontal and vertical polarization of detecting antenna.

The worst case data is reported.
