

EMC EMISSION - TEST REPORT

Test Report No.	B907501	Issue Date	14 March 1999
Model / Serial No.	HG200W / SFW001		
Product Type	Wrist-Mount Low Power RF Transmitter		
Client	BI, Inc.		
Manufacturer	BI, Inc.		
License holder	BI, Inc.		
Address	6400 Lookout Road Boulder, CO 80301		
Test Criteria Applied	FCC Part 15C	15.231	
Test Start Date:	08 March 1999		
Test End Date:	08 March 1999		
Test Result	☒ PASS ☐ FAIL		
Test Report Project No.	BC1G907501		
Total Pages including Appendices	40		

Reviewed By : Felix J. Chavez

Reviewed By : Shawn Singh

TÜV Product Service Inc is a subcontractor to TÜV Product Service, GmbH according to the principles outlined in ISO/IEC Guide 25 and EN 45001.

TÜV Product Service Inc reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. TÜV Product Service Inc shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV Product Service Inc issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval of TÜV Product Service. This report shall not be used by the client to claim product endorsement by NVLAP or any agency of the US government.

TÜV Product Service Inc and its professional staff hold government and professional organization certifications and are members of AAMI, ACIL, AEA, ANSI, IEEE, NVLAP, and VCCI

EMISSIONS TEST REGULATIONS :

The tests were performed according to following regulations :

- | | | |
|---|--|---|
| ☒ - Federal Communication Commission part 15 | ☐ - Class A | ☒ - Class B |
| ☒ - Federal Communication Commission part 15, Subpart C | ☒ - 15.209 | ☒ - 15.231 |

All tests performed according to ANSI C63.4.

Emission Test Results:

Conducted emissions 150 kHz - 30 MHz

Test Result ☐ - PASS ☐ - FAIL ☒ - Not Applicable

Passing Margin _____ dB at _____ MHz

Remarks: EUT is battery operated.

Radiated emissions (electric field) 30 MHz - 1000 MHz (Unintentional Radiator)

Test Result ☒ - PASS ☐ - FAIL ☐ - Not Applicable

Passing Margin 22.7 dB at 60.49 MHz

Remarks: _____

Radiated emissions (electric field) 314.2 MHz - 3142 MHz (Intentional Radiator)

Test Result ☒ - PASS ☐ - FAIL ☐ - Not Applicable

Passing Margin 12.8 dB at 628.4 MHz

Remarks: _____

GENERAL REMARKS:

Modifications required to pass: None

Test Specification Deviations: Additions to or Exclusions from: None

15.231(e) PERIODIC OPERATION INTENTIONAL RADIATOR

Date: 8-Mar-99
EUT: Wrist-Mount Low Power RF Transmitter
Manufacturer: BI Inc.
Representative: Don Melton

Measured @
 314.2 MHz

Miscellaneous Measurements:

<u>FCC Specification</u>	<u>Measurement</u>
1) 20 dB Bandwidth	376 kHz

Tx Mode: Radiated Measurements

Calculated Averaging Factor: -20 dB (20*Log(duty cycle))
Averaging Factor Applied: -20 dB

Fundamental Field Strength:

Specification	Peak Measurement dBuV/m @ MHz	Average Measurement dBuV/m @ MHz
67.6 dBuV/m	85.9	65.9
	314.2	314.2

Harmonics	Specification	Peak Measurement dBuV/m @ MHz	Average Measurement dBuV/m @ MHz	Delta dB
2nd harmonic (628.4 MHz)	47.6 dBuV/m	54.8	34.8	-12.8
3rd harmonic (942.6 MHz)	47.6 dBuV/m	50.6	30.6	-17.0
4th harmonic (1256.8 MHz)	54 dBuV/m	35.7	15.7	-38.3
5th harmonic (1571 MHz)	54 dBuV/m	39.0	19.0	-35.0
6th harmonic (1885.2 MHz)	54 dBuV/m	No emissions were found above the receiver's noise floor		
7th harmonic (2199.4 MHz)	54 dBuV/m	No emissions were found above the receiver's noise floor		
8th harmonic (2513.6 MHz)	54 dBuV/m	No emissions were found above the receiver's noise floor		
9th harmonic (2827.8 MHz)	54 dBuV/m	No emissions were found above the receiver's noise floor		
10th harmonic (3142 MHz)	54 dBuV/m	No emissions were found above the receiver's noise floor		

Minimum Passing Margin: -12.8 dB

I/O Ports and Cables

Indicate all interface cables which can be attached to the equipment even if they are not sold as part of your system. Describe the port (e.g., Parallel, Serial, SCSI), list its type (e.g., AC, DC, Signal, Control) and number of ports/cables of type. Indicate if the I/O port is to be exercised during testing. List the type of transmission and if the cable is an EUT assembly-to-assembly interconnection cable (PC to printer, to modem). Indicate whether the cable is shielded or not, type of shield (e.g. Braid, Foil) and how terminated (e.g. 360 degree to conductive shell, pigtail) at both ends of the cable. If a cable can have a typical length of ≥ 3.0 meters, then it is required to test with a cable of at least 3.0 meters.

Revised: 29 September 1998

Constructional Data Form for Electromagnetic Compatibility Testing

EUT configurations -- Provide a technical description of all possible EUT configurations. Specify if more than one configuration is to be tested.

Attached to an ankle or wrist with the companion strap, supplied by BI.

EUT Software and Operation Modes to be Tested -- list the operating modes to be used during test. It is recommended the equipment be tested while operating in a typical operation mode. Consult with your TÜV Product Service Representative when typical operating modes are not practical. FCC testing of personal computers and/or peripherals requires that a simple program generate a complete line of upper case H's. This pattern must be sent to the parallel port device, serial port device, and must be write/read/verified to each storage device. Monitors must display the H pattern, typically in white letters on a black background. Provide a general description of all software, firmware, and PLD algorithms used in the equipment. List all code modules as described above, with the revision level used during testing.

General Description:
(describe)

Normal mode includes transmission of a data packet in pseudorandom timing intervals of several seconds to tens of seconds. A special test mode is included to transmit every 0.5 second to facilitate testing.

Software Revision Level:
(list and describe)

N/A

Operating modes to be
tested: (list and describe)

Normal mode includes transmission of a data packet in pseudorandom timing intervals of several seconds to tens of seconds. A special test mode is included to transmit every 0.5 second to facilitate testing. A typical strap will be attached to the EUT.

Appendix F

Measurement of Protocol

MEASUREMENT PROTOCOL FOR FCC

GENERAL INFORMATION

Measurement Uncertainty

The test system for conducted emissions is defined as the LISN, tuned receiver or spectrum analyzer, and coaxial cable. The test system for radiated emissions is defined as the antenna, the pre-amplifier, the spectrum analyzer and the coaxial cable. These test systems have a measurement uncertainty of ± 4.5 dB. The equipment comprising the test systems are calibrated on an annual basis.

Justification

The Equipment Under Test (EUT) is configured in a typical user arrangement in accordance with the manufacturer's instructions. A cable is connected to each available port and either terminated with a peripheral into its characteristic impedance or left unterminated. When appropriate, the cables are manually manipulated with respect to each other to obtain maximum emissions from the unit.

CONDUCTED EMISSIONS

The final level, expressed in dB μ V, is arrived at by taking the reading directly from the EMI receiver. This level is compared directly to the FCC limit.

To convert between dB μ V and μ V, the following conversions apply:

$$\text{dB}\mu\text{V} = 20(\log \mu\text{V})$$

$$\mu\text{V} = \text{Inverse log}(\text{dB}\mu\text{V}/20)$$

RADIATED EMISSIONS

The final level, expressed in dB μ V/m, is arrived at by taking the reading from the spectrum analyzer (Level dB μ V) and adding the antenna correction factor and cable loss factor (Factor dB) to it. This result then has the FCC limit subtracted from it to provide the Delta which gives the tabular data as shown in the data sheets in Attachment B. The amplifier gain is automatically accounted for by using an analyzer offset.

Example:

Frequency (MHz)	Level (dB μ V)	+	Factor & Cable (dB)	=	Final (dB μ V/m)	-	FCC B Limit (dB μ V/m)	=	Delta FCC B (dB)
32.21	13.9	+	16.3	=	30.2	-	40.0	=	-9.8

DETAILS OF TEST PROCEDURES

General Standard Information

The test methods used comply with ANSI C63.4-1992 - "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz."

Conducted Emissions

Conducted emissions on the 60 Hz power interface of the EUT are measured in the frequency range of 450 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection, and a Line Impedance Stabilization Network (LISN), with 50 Ω /50 μ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. In some cases, a pre-scan using a spectrum analyzer is initially performed on the units comprising the system under test to locate the highest emissions. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are re-measured using a tuned receiver or spectrum analyzer with quasi-peak and average detection and recorded on the data sheets.

Radiated Emissions

Radiated emissions from the EUT are measured in the frequency range of 30 to 3142 MHz using a spectrum analyzer and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with 120 kHz/6 dB bandwidth and peak or quasi-peak detection and measurements above 1000 MHz are made with a 1 MHz/6 dB bandwidth and peak detection. Average field strength levels were computed from the peak readings and duty cycle of the transmitter. Table top equipment is placed on a 1.0 X 1.5 meter non-conducting table 80 centimeters above the ground plane. Floor standing equipment is placed directly on the turntable/ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna is positioned 3 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarizations and the EUT are rotated 360 degrees. Intentional radiators are rotated through three orthogonal axes to determine the attitude that maximizes the emissions.
