EUT Notes: The EUT is an amplifier which receives RF input signal through a permanently conducted connection. The EUT amplifies when a $\geq +16$ dBm signal is received via this connection. Therefore, a KDB inquiry was filed to exempt a related device from Noise figure measurements, and was accepted by the FCC in KDB inquiry 925403. Furthermore, since the device will never handle multiple signals, another KDB inquiry was filed to exempt a related device from Out-Of-Block Intermodulation testing which was also accepted by the FCC in KDB inquiry 885618. Testing reflects these exemptions.

Note: The most strict limit possible for this device was used for all measurements which utilize a limit for emissions outside 250% of the bandwidth. This was found by combining the least output power level with the most strict >250% BW dBc limit in 90.210 used by this device. This is expressed as:

454.5 MHz output of 46.75 dBm – 66.99 dBc (Mask D) = -20.26 dBm

INPUT-VERSUS-OUTPUT SIGNAL COMPARISON §4.4

Rule Part No.: FCC Pt. 90.210
KDB 935210-D05 v01r02 §4.4
KDB 971168-D01 v03 §4
KDB 971168-D03 v01

Requirements: For devices that are classified as signal boosters under §§ 20.21 or 90.219, please refer to KDB Publication 935210 for the applicable procedures. In addition, for any devices like amplifiers, repeaters, and boosters, a comparison of the input modulated spectrum and the output modulated spectrum are required. This corresponds to the occupied bandwidth test required under § 2.1049.

A signal booster must be designed such that all signals that it retransmits meet the following requirements:

The signals are retransmitted on the same channels as received. Minor departures from the exact provider or reference frequencies of the input signals are allowed.

There is no change in the occupied bandwidth of the retransmitted signals.

The retransmitted signals continue to meet the unwanted emissions limits of §90.210 applicable to the corresponding received signals (assuming that these received signals meet the applicable unwanted emissions limits by a reasonable margin).

Procedure: KDB935210 § 4.4 - Input versus output signal comparison

KDB 971168-D01 v03 §4 - The relative OBW must be measured and reported when it is specified in the applicable rule part;
Otherwise, the 99 % OBW shall be measured and reported.

KDB 935210-D05 v01r02 §4.9

Requirements: 2.5 ppm

Procedure: KDB935210 Measurement Guidance for Industrial Boosters
§ 4.8 Frequency Stability Measurements

FCC Part 22 states "Except as otherwise provided in this part, the carrier frequency of each transmitter in the Public Mobile Services must be maintained within the tolerances given in Table C-1 of this section."

This requirement presumes that the EUT processes an input signal in ways that can influence the output signal frequency/frequencies; however, most signal boosters do not incorporate an oscillator. If the amplifier, booster, or repeater does not alter the input signal in any way, then a frequency stability test may not be required per KDB 935210-D05 v01r02 §4.9.

Result: Not required per KDB 935210-D05 v01r02 §4.9

§ 4.7.1 General

The tabulated data shows the results of the radiated field strength emissions test. The spectrum was scanned from 9 KHz to at least the tenth harmonic of the fundamental. The EUT was oriented in the worst-case polarity, and was scanned in the worst-case emission range as determined in prior testing. Measurements were made at the test site of **TIMCO ENGINEERING, INC. located at 849 NW State Road 45, Newberry, FL 32669.**

NOTE: The highest six (6) emissions per operating band are tabulated in the plots below. Emissions under 20 dB within the applicable limit(s) are not required to be shown.

STATEMENT OF MEASUREMENT UNCERTAINTY

The data and results referenced in this document are true and accurate. The measurement uncertainty was calculated for all measurements listed in this test report according To CISPR 16-4 or ENTR 100-028 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: “Uncertainty in EMC Measurements” and is documented in the Timco Engineering, Inc. quality system according to DIN EN ISO/IEC 17025. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

Hereafter the best measurement capability for Timco Engineering, Inc. is reported:

Test Items	Measurement Uncertainty	Notes
RF Frequency Accuracy	± 49.5 Hz	(1)
RF Conducted Power	± 0.93 dB	(1)
Conducted spurious emission of transmitter valid up to 40GHz	± 1.86 dB	
Occupied Bandwidth	± 2.65 %	
Audio Frequency Response	± 1.86 dB	
Modulation limiting	± 1.88 %	
Radiated RF Power	± 1.4 dB	
Maximum frequency deviation: Within 300 Hz and 6kHz of audio freq.	± 1.88 %	
Within 6kHz and 25kHz of audio Freq.	± 2.04 %	
Rad Emissions Sub Meth up to 26.5GHz	± 2.14 dB	
Rad Emissions Sub Meth up to 18-40 GHz	± 2.04 %	
Adjacent channel power	± 1.47 dB	(1)
Transient Frequency Response	± 1.88 %	
Temperature	$\pm 1.0^{\circ}$ C	(1)
Humidity	± 5.0 %	

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=1.96$.
