FCC PT. 90 TEST REPORT 220 – 222 MHz Band Amplifier

APPLICANT	CRESCEND TECHNOLOGIES, LLC
ADDRESS	140 E. State Parkway SCHAUMBURG IL 60173 USA
FCC ID	CWWP10XXFA4
MODEL NUMBER	P10-1FA4-C5-001
PRODUCT DESCRIPTION	POWER AMPLIFIER
DATE SAMPLE RECEIVED	2/22/2018
DATE TESTED	3/16/2018
TESTED BY	Franklin Rose
APPROVED BY	Tim Royer
TEST RESULTS	☒ PASS ☐ FAIL

Report Number	Version Number	Description	Issue Date
280AUT18TestReport	Rev1	Initial Issue	03/16/2018
280AUT18TestReport	Rev2	Update Power Output data	07/10/2018
280AUT18TestReport	Rev3	Updated Calibration Date	07/18/2018

THE ATTACHED REPORT SHALL NOT BE REPRODUCED EXCEPT IN FULL
WITHOUT THE WRITTEN APPROVAL OF TIMCO ENGINEERING, INC.

GENERAL REMARKS

The attached report shall not be reproduced except in full without the written permission of Timco Engineering Inc.

Summary

The device under test does:

☒ Fulfill the general approval requirements as identified in this test report and was selected by the customer.

☐ Not fulfill the general approval requirements as identified in this test report

Attestations

This equipment has been tested in accordance with the standards identified in this test report. To the best of my knowledge and belief, these tests were performed using the measurement procedures described in this report.

All instrumentation and accessories used to test products for compliance to the indicated standards are calibrated regularly in accordance with ISO 17025 requirements.

I attest that the necessary measurements were made at:

Timco Engineering Inc.
849 NW State Road 45
Newberry, FL 32669
Tested by:

A handwritten signature in blue ink is written over a red circular stamp. The stamp contains the text "TIMCO ENGINEERING INC." around the perimeter and "NEWBERRY, FL 32669" in the center.

KDB 935210-D05 v01r01 §4.3	Reporting Only	Out-Of-band rejection	CLASS B
90.219(e)(1) AND KDB 935210-D05 v01r01 §4.5	Reporting Only	Input/output power	PASS
KDB 935210-D05 v01r01 §4.2	Reporting Only	AGC Threshold	PASS
90.219(e)(3) AND KDB 935210-D05 v01r01 §4.7.2	-13 dBm	Out-of-band/out-of-block Intermodulation	NOT REQUIRED
90.219(e)(2) AND KDB 935210-D05 v01r01 §4.6	9 dB	Noise Figure	PASS
90.219(e)(3) AND KDB 935210-D05 v01r01 §4.7.3	-13 dBm	Spurious Emissions Conducted	PASS
90.219(e)(4) AND KDB 935210-D05 v01r01 §4.4	Reporting Only	Input-versus-output signal comparison	PASS
90.219(e)(3) AND KDB 935210-D05 v01r01 §4.9	-13 dBm	Spurious emissions radiated	PASS
90.213 AND KDB 935210-D05 v01r01 §4.8	N/A	Frequency Stability	NOT REQUIRED

OUT-OF-BAND REJECTION

Rule Part No.: KDB 935210 §4.3 Out of band rejection

Requirements: Reporting Only

Test Data: Amplifier Passband

Date: 2.MAR.2018 17:05:59

Operating Range: 220 MHz to 222 MHz = 2 MHz Passband

(Not authorized for transmission outside authorized band; for use solely with 220 – 222 FCC Part 90 certified devices using a conducted input).

RESULT: CLASS B EQUIPMENT

INPUT OUTPUT POWER

Applicable Rule Part: 90.219(d)(3), 90.729(a), KDB 935210-D05 v01r01 §4.5

Requirements:

90.219(d)(3) The output power capability of a signal booster must be designed for deployments providing a radiated power not exceeding 5 Watts ERP for each retransmitted channel.

90.729(a) The permissible effective radiated power (ERP) with respect to antenna heights for land mobile, paging, or fixed stations transmitting on frequencies in the 220-221 MHz band shall be determined from the following Table. These are maximum values and applicants are required to justify power levels requested.

ERP VS. ANTENNA HEIGHT TABLE²

Antenna height above average terrain (HAAT), meters	Effective radiated power, watts ¹
Up to 150	500
150 to 225	250
225 to 300	125
300 to 450	60
450 to 600	30
600 to 750	20
750 to 900	15
900 to 1050	10
Above 1050	5

¹Transmitter PEP shall be used to determine ERP.

²These power levels apply to stations used for land mobile, paging, and fixed operations.

The stricter of the ERP limit of 90.219(d)(3) and 90.729(a) = **5.0 W**

Input Freq. (MHz)	Input Power (dBm)	Output Power (dBm)	Output Power (W)	ERP Limit of 90.219 (W)	Ant. Gain (dBi)	ERP (dBm)	ERP (W)	Final Gain (dB)
220.025	30.04	49.97	99.31	5.00	-13.00	36.97	5.0	6.9
221.975	30.04	50.03	100.69	5.00	-13.00	37.03	5.0	7.0
220.025	36.00	49.93	98.40	5.00	-13.00	36.93	4.9	0.9
221.975	36.00	49.99	99.77	5.00	-13.00	36.99	5.0	1.0

RESULT: MEETS REQUIREMENTS

AGC THRESHOLD

Rule Part No.: KDB935210 § 4.2

Requirements: Reporting only, used to determine test input levels

Procedure: KDB935210 Measurement Guidance for Industrial Boosters
§ 4.2 Measuring AGC threshold

Test Data: Downlink Output 1 Measurement Table

Gen Freq (MHz)	Gen Output (dBm)	Test Signal Amplifier Output(dBm)	Insertion Loss (dB)	Booster Input (dBm)	Booster Output (dBm)
221.00	-12.00	28.05	0.3	28.4	0.00
221.00	-11.00	29.05	0.3	29.4	0.00
221.00	-10.00	30.04	0.3	30.3	50.03
221.00	-9.00	31.04	0.3	31.3	50.03
221.00	-8.00	32.00	0.3	32.3	50.02
221.00	-7.00	33.96	0.3	34.3	50.03

NOTE: Yellow denotes amplifier “turn-on” level; Green denotes +3 dBm above “turn-on” level.

RESULT: Device does not employ AGC

INTERMODULATION PRODUCTS

Applicable Rule Part: 90.219(e)(3), KDB 935210-D05 v01r01 §4.7.2

Requirements: Spurious emissions from a signal booster must not exceed –13 dBm within any 100 kHz measurement bandwidth.

KDB 935210-D05 v01r01 §4.7.1

NOTE—Intermodulation-product spurious emission measurements are not required for single-channel boosters that cannot accommodate two simultaneous signals within the passband.

Findings: This EUT is only capable of passing one signal at a time; Intermodulation products require two input signals and were unable to be tested.

Conclusion: The EUT does not experience intermodulation since it:

- a) is meant for permanent connection to the antenna port of one (1) FCC Part 90 transmitter, and;
- b) only receives and is only capable of receiving one signal at a time.

RESULT: N/A

NOISE FIGURE

Applicable Rule Part: 90.219(e)(2), KDB 935210-D05 v01r01 §4.6

Requirements: The noise figure of a signal booster must not exceed 9 dB in either direction.

KDB 935210-D05 v01r01 §4.6

Section 90.219(e)(2) limits the noise figure of a signal booster to ≤ 9 dB in either direction. The following discussion provides guidance for demonstrating compliance with this requirement.

Several widely recognized methods for performing noise figure measurements are available. Some require the use of specialized equipment, such as a noise figure analyzer and/or an excess noise ratio (ENR) calibrated noise source, while others involve the use of conventional measurement instrumentation such as a spectrum analyzer. Methods that require use of a noise figure analyzer are generally accepted as producing the most accurate results, and are considered to be the reference method within this document, while others are considered to be acceptable alternative methods. Consult the relevant instrumentation application notes for detailed guidance regarding the selection and application of an appropriate methodology for performing noise figure measurements. Note also that noise figure measurements require that any AGC circuitry be disabled over the duration of the measurement.

CONDUCTED SPURIOUS EMISSIONS

Applicable Rule Part: 90.219(e)(3), KDB 935210-D05 v01r01 §4.7.3

Requirements: Spurious emissions from a signal booster must not exceed -13 dBm within any 100 kHz measurement bandwidth.

Test Data: 220.025 MHz Channel

Date: 5.MAR.2018 12:09:19

SPURIOUS EMISSIONS §6.5

Test Data: 221.975 MHz Channel

RESULT: MEETS REQUIREMENTS

INPUT VS OUTPUT SIGNAL COMPARISON

Applicable Rule Part: 90.219(e)(4), KDB 935210-D05 v01r01 §4.4

Requirements: A signal booster must be designed such that all signals that it retransmits meet the following requirements:

The signals are retransmitted on the same channels as received. Minor departures from the exact provider or reference frequencies of the input signals are allowed, provided that the retransmitted signals meet the requirements of §90.213.

There is no change in the occupied bandwidth of the retransmitted signals.

The retransmitted signals continue to meet the unwanted emissions limits of §90.210 applicable to the corresponding received signals (assuming that these received signals meet the applicable unwanted emissions limits by a reasonable margin).

INPUT VS OUTPUT SIGNAL COMPARISON

The Aggregated Channels used with Emission Mask F in this test report are as follows. These are not indicative of the equipment under test. The EUT is capable of reproducing the input signal in any desired bandwidth within 220 – 222 MHz.

2 Aggregate Channel Emission Mask: “Mask_F2”

3 Aggregate Channel Emission Mask: “Mask_F3”

4 Aggregate Channel Emission Mask: “Mask_F4”

7 Aggregate Channel Emission Mask: “Mask_F7”

FIELD STRENGTH OF RADIATED EMISSIONS -

Applicable Rule Part: 90.219(e)(3), KDB 935210-D05 v01r01 §4.9

Requirements: Spurious emissions from a signal booster must not exceed -13 dBm within any 100 kHz measurement bandwidth.

The tabulated data shows the results of the radiated field strength emissions test. The spectrum was scanned from 9 KHz to at least the tenth harmonic of the fundamental. The EUT was oriented in the worst-case polarity, and was scanned in the worst-case emission range as determined in prior testing. Measurements were made at the test site of **TIMCO ENGINEERING, INC. located at 849 NW State Road 45, Newberry, FL 32669.**

Test Data: 220.025 MHz Radiated Emission Table

Emission Freq. (MHz)	Meter Reading (dBuV)	Ant. Polarity	Coax Loss (dB)	Correction Factor (dB/m)	Field Strength (dBuV/m)	ERP (dBm)	Limit (dBm)	Margin (dBm)

RESULT: MEETS REQUIREMENTS

FREQUENCY STABILITY §6.6

Applicable Rule Part: 90.213, KDB 935210-D05 v01r01 §4.8

KDB 935210-D05 v01r01 §4.8 Frequency stability measurements Section 90.219(e)(4)(i) requires that a signal being retransmitted by an amplifier, repeater, or industrial booster meets the frequency stability requirements of Section 90.213. However, this requirement presumes that the EUT processes an input signal in ways that can influence the output signal frequency/frequencies; however, most signal boosters do not incorporate an oscillator). **If the amplifier, booster, or repeater does not alter the input signal in any way, then a frequency stability test may not be required.**

Result: n/a

STATE OF THE MEASUREMENT UNCERTAINTY – 160419

The data and results referenced in this document are true and accurate. The measurement uncertainty was calculated for all measurements listed in this test report according To CISPR 16 – 4 or ENTR 100-028 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: “Uncertainty in EMC Measurements” and is documented in the Timco Engineering, Inc. quality system according to DIN EN ISO/IEC 17025. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device.

Hereafter the best measurement capability for Timco Engineering, Inc. is reported:

Test Items	Measurement Uncertainty	Notes
RF Conducted Power	$\pm 1.4\text{dB}$	(1)
RF Antenna Conducted Emissions	$\pm 2.4\text{ dB}$	(1)
Maximum Deviation	$\pm 1.3\%$	(1)
Occupied Bandwidth	$\pm 2.5\%$	(1)
Adjacent Channel Power	$\pm 1.5\text{dB}$	(1)
Frequency Stability	$\pm 69.5\text{ Hz}$	(1)
Transmitter power Radiated Substitution Method	$\pm 4.0\text{ dB}$	(1)
Transmitter Transient Frequency Response	$\pm 2.0\text{ dB}$	(1)

- (1) This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=1.96$.

EQUIPMENT LIST
