4 Introduction

This report TRA-029575-02-45-08C presents the results of the Radio testing on a EchoStar Europe, Project N63 to specification 47CFR15 Radio Frequency Devices and RSS-247 Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices.

The testing was carried out for EchoStar Europe by Element, at the address(es) detailed below.

☒	Element Hull Unit E South Orbital Trading Park Hedon Road Hull HU9 1NJ UK	☐	Element Skelmersdale Unit 1 Pendle Place Skelmersdale West Lancashire WN8 9PN UK

This report details the configuration of the equipment, the test methods used and any relevant modifications where appropriate.

FCC Site Listing:

The test laboratory is accredited for the above sites under the US-EU MRA, Designation number UK0009.

IC Registration Number(s):

Element Skelmersdale	3930B
Element Hull	3483A

The test site requirements of ANSI C63.4-2014 are met up to 1GHz.

The test site SVSWR requirements of CISPR 16-1-4:2010 are met over the frequency range 1 GHz to 18 GHz.

7.3 EUT Mode of Operation

7.3.1 Transmission

The mode of operation for transmitter tests was as follows.

Wi-Fi transmitter control was via commands sent through MTool v2.0.3.2 software. The commands provided by the manufacturer setup the device into a permanent transmit mode. For each type of test, lowest and highest data rates were investigated to find the worst case data rate. Only the worst case results are reported. The commands allowed adjustment of the following parameters of significant interest.

CDD modes were selected as the worst case from initial investigative measurements.

7.5 EUT Description

The EUT is a dual band Wi-Fi router with Bluetooth. The radios are contained on two separate modules. One module contains a 5 GHz Wi-Fi Access Point, and the other module contains a dual-band Wi-Fi Client and a dual-mode Bluetooth radio. All radios within the device are capable of simultaneous transmission. It is intended for both indoor and outdoor use (mobile, not portable).

This report only covers 5 GHz Wi-Fi Client. This radio is a DFS Slave device without radar detect. It uses the following operating schemes (beamformig is not supported):

- SISO (single antenna transmission)
- SM-MIMO (multiple antenna transmission, uncorrelated)
- STBC (multiple antenna transmission, uncorrelated)
- CDD (multiple antenna transmission, correlated)

Testing is only performed in CDD mode with both antennas' active.

It uses 6 modulation schemes in the 5 GHz band:

- 802.11a (20 MHz)
- 802.11n (20 MHz)
- 802.11n (40 MHz)
- 802.11ac (20 MHz)
- 802.11ac (40 MHz)
- 802.11ac (80 MHz)

And can transmit in the following bands:

- U-NII-1
- U-NII-2A
- U-NII-2C
- U-NII-3

There are 2 antennas of known gain

8 Modifications

No modifications were performed during this assessment.

10 General Technical Parameters

10.1 Normal Conditions

The E U T was tested under the normal environmental conditions of the test laboratory, except where otherwise stated. The normal power source applied was approx. 110 V ac from the mains.

10.2 Varying Test Conditions

Variation of supply voltage is required to ensure stability of the declared output power and frequency. During carrier power testing the following variations were made:

	<i>Category</i>	<i>Nominal</i>	<i>Variation</i>
☒	Mains	110V ac +/-2%	85% and 115%
☐	Battery	New battery	N/A

11 Occupied Bandwidth

11.1 Definition

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal.

11.2 Test Parameters

Test Location:	Element Hull
Test Chamber:	Wireless Laboratory 1
Test Standard and Clause:	ANSI C63.10-2013, Clause 6.9
EUT Channels / Frequencies Measured:	Low / Mid / High
EUT Channel Bandwidths:	20 / 40 / 80 MHz
EUT Test Modulations:	OFDM, VHT20MCS0, VHT40MCS0, VHT80MCS0
Deviations From Standard:	None
Measurement BW:	100 kHz
(FCC requirement: 100 kHz)	
Spectrum Analyzer Video BW:	300 kHz
(requirement at least 3x RBW)	
Measurement Detector:	Peak

Environmental Conditions (Normal Environment)

Temperature: 21°C	+15 °C to +35 °C (as declared)
Humidity: 50%RH	20%RH to 75%RH (as declared)
Supply: 12V dc	

Test Limits

Within the 5.725–5.85 GHz band, the minimum 6 dB bandwidth of U–NII devices shall be at least 500 kHz.

11.3 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iii, the bandwidth of the EUT was measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

12 Maximum conducted output power

12.1 Definition

The maximum conducted output power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level.

12.2 Test Parameters

Test Location:	Element Hull
Test Chamber:	Lab4 (Wireless Lab1)
Test Standard and Clause:	ANSI C63.10-2013, Clause 12.3
EUT Channels / Frequencies Measured:	Low / Mid / High
EUT Occupied Bandwidths:	20, 40 and 80 MHz
Deviations From Standard:	None
Measurement Detector:	Max. e.i.r.p readings on Dare Probe REF2112
Voltage Extreme Environment Test Range:	Mains Power = 85% and 115% of Nominal (FCC only requirement); Battery Power = new battery.

Environmental Conditions (Normal Environment)

Temperature: 21°C	+15 °C to +35 °C (as declared)
Humidity: 52%RH	20%RH to 75%RH (as declared)

Test Limits

For an access point operating in the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W.

For an outdoor access point operating in the band 5.15–5.25 GHz, the maximum e.i.r.p. at an elevation angle above 30 degrees as measured from the horizon must not exceed 125 mW (21 dBm).

For mobile and portable client devices in the 5.15–5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW.

For the 5.25–5.35 GHz and 5.47–5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. Transmit Power Control is not required where the e.i.r.p. is less than 500 mW.

For the band 5.725–5.85 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W.

If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Fixed point-to-point U-NII devices operating in the band 5.725–5.85 GHz may employ antennas with directional gain greater than 6 dBi without any corresponding reduction in transmitter conducted power.

Fixed point-to-point U-NII devices operating in other bands may employ antennas with directional gain up to 23dBi without any corresponding reduction in the maximum conducted output power or maximum power spectral density. For fixed point-to-point transmitters that employ a directional antenna gain greater than 23 dBi, a 1 dB reduction in maximum conducted output power and maximum power spectral density is required for each 1 dB of antenna gain in excess of 23 dBi.

12.3 Test Method

The EUT (Sample Host29 AP34) was setup as per section 9 of this report and, as per Figure iv, the analyser was used to measure each antenna output in turn, having taken account of all path losses. The resolution bandwidth of the spectrum analyser was set between 1 and 5 % of the EUT occupied bandwidth and the analyser band power function used to calculate the average power. The results were summed as in the tables below.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

13 Power spectral density

13.1 Definition

The power spectral density is the total energy output per unit bandwidth from a pulse or sequence of pulses for which the transmit power is at its maximum level, divided by the total duration of the pulses.

13.2 Test Parameters

Test Location:	Element Hull
Test Chamber:	Wireless Laboratory 1
Test Standard and Clause:	ANSI C63.10-2013, Clause 12.5 KDB789033 D02 v01r02
EUT Channels / Frequencies Measured:	Low / Mid / High
EUT Channel Bandwidths:	20 / 40 / 80 MHz
Deviations From Standard:	None
Measurement BW:	1 MHz
Spectrum Analyzer Video BW: (requirement at least 3x RBW)	3 MHz
Measurement Span:	20 / 40 / 80 MHz
Measurement Detector:	RMS

Environmental Conditions (Normal Environment)

Temperature: 21 °C	+15 °C to +35 °C (as declared)
Humidity: 53 %RH	20%RH to 75%RH (as declared)
Supply: 110 Vac	

Test Limits

For an access point operating in the band 5.15–5.25 GHz the maximum power spectral density shall not exceed 17 dBm in any 1 megahertz band.

For mobile and portable client devices in the 5.15–5.25 GHz band, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band.

For the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band.

For the band 5.725–5.85 GHz, the maximum power spectral density shall not exceed 30 dBm in any 500-kHz band.

If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Fixed point- to-point U-NII devices may employ antennas with directional gain up to 23dBi without any corresponding reduction in the maximum conducted output power or maximum power spectral density. For fixed point-to-point transmitters that employ a directional antenna gain greater than 23 dBi, a 1 dB reduction in maximum conducted output power and maximum power spectral density is required for each 1 dB of antenna gain in excess of 23 dBi.

13.3 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure v, the peak emission of the EUT was measured on a spectrum analyser, with path losses taken into account. The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

14 Out-of-band spurious emissions

14.1 Definition

Out-of-band emission.

Emission on a frequency or frequencies immediately outside the necessary bandwidth that results from the modulation process but excluding spurious emissions.

Spurious emission.

Emission on a frequency or frequencies that are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products, and frequency conversion products, but exclude out-of-band emissions.

Conversion from field strength to eirp is as follows:

$$\text{EIRP} = E + 20\log(d) - 104.77, \text{ where}$$

EIRP is the equivalent isotropically radiated power in dBm;

E is field strength in dBμV/m;

d is the measurement distance in meters.
