4 Summary of test results

4.1 Test results

No.	Item	Test Procedure	Specification	Remarks	Result
1	Electric Field Strength of Fundamental Emission	FCC/ANSI C63.4:1992	FCC Part15 Subpart C §15.225(a)	3m	Complies
2	Electric Field Strength of Spurious Emission	FCC/ANSI C63.4:1992	FCC Part15 Subpart C §15.225(b)	3m	Complies
3	Frequency Tolerance	FCC/ANSI C63.4:1992	FCC Part15 Subpart C §15.225(c)	-	Complies

A-PEX INTERNATIONAL hereby confirms that E.U.T. , in the configuration tested, complies with the specifications FCC Part15 Subpart C.

4.2 Electric Field Strength Measurement of Fundamental Frequency

The following table lists frequency at which emissions were measured using a Quasi-Peak detector and at a test distance of 3m

Frequency (MHz)	Ant. Receiver Reading (dB μ V)	Correction Factor (dB)	Field Strength (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)
13.56	76.0	-9.1	66.9	120.0	53.1

Note: The limit was calculated using the square of an inverse linear distance extrapolation factor (40dB/decade) .i.e $40\log_{10}(d1/d2)$.

30m Fundamental Emission Limit (10,000 μ V/m) = $20\log_{10}(10,000) = 80\text{dB } \mu\text{ V/m}$

3m Fundamental Emission Limit = $80\text{dB } \mu\text{ V/m} + 40\log_{10}(30/3) = 120\text{dB } \mu\text{ V/m}$

Field strength calculation

The field strength is calculated by adding the Antenna Factor, Cable Factor and Antenna Pad, and subtracting the Amplifier Gain from the measured reading. The sample calculation is as follows :

$$FS = RA + AF + CF + AT - AG$$

where FS = Field Strength

RA = Receiver Amplitude

AF = Antenna Factor

CF = Cable Factor

AG = Amplifier Gain

Assume a receiver reading of 76.0 dB μ V is obtained. The antenna Factor of 20.2 dB and Cable Factor of 0.8 dB is added. The Amplifier Gain of 30.1 dB is subtracted, giving a field strength of 66.9 dB μ V/m.

$$FS = 76.0 + 20.2 + 0.8 - 30.1 = 66.9 \text{ dB } \mu\text{ V/m}$$

4.3 Electric Field Strength of Spurious Emission

The initial step in collecting radiated data was a spectrum analyzer peak scan of the measurement range (9kHz-1000MHz).

The final data was reported in the worst-case emissions.

The following table lists frequency at which emissions were measured using a Quasi-Peak detector and at a test distance of 3m

The minimum margin to the limit is as follows :

Frequency (MHz)	Ant. Pol.	Receiver Reading (dB μ V)	Correction Factor (dB)	Field Strength (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)
325.45	H	47.4	-2.7	44.7	46.0	1.3

Field strength calculation

The field strength is calculated by adding the Antenna Factor, Cable Factor and Antenna Pad, and subtracting the Amplifier Gain from the measured reading. The sample calculation is as follows :

$$FS = RA + AF + CF + AT - AG$$

where FS = Field Strength

RA = Receiver Amplitude

AF = Antenna Factor

CF = Cable Factor

AT = Antenna Pad

AG = Amplifier Gain

Assume a receiver reading of 47.4 dB μ V is obtained. The antenna Factor of 16.9 dB, Cable Factor of 4.3 dB and Antenna Pad of 5.9 dB is added. The Amplifier Gain of 29.8 dB is subtracted, giving a field strength of 44.7 dB μ V/m.

$$FS = 47.4 + 16.9 + 4.3 + 5.9 - 29.8 = 44.7 \text{ dB } \mu \text{ V/m}$$

5.3 Test conditions

Frequency range : 9kHz-30MHz (Loop antenna) / 30MHz-300MHz (biconical antenna)
/ 300MHz-1000MHz (Log-periodic antenna)

Test distance : 3m

EUT position : Table top

5.4 Test procedure

The Radiated Electric Field Strength intensity has been measured on an open test site with a ground plane at a distance of 3m from the EUT to the antenna.

Pre check measurements were performed in a shielded room or used search coil for ambient noise at high-level, especially from 272MHz to 288MHz.

Measurements were performed with a quasi-peak detector.

The measuring antenna height was varied between 1m to 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization.

The EUT was put into operation at Running mode.
