

3. Block diagram

This is the block diagram concerning to the transmitter (G8D-522M-A)

figure 3.1 block diagram of the transmitter

4. Specification

4.1 CPU

Type	uPD754144GS(4bit) Manufacturer: NEC Corporation
ROM	4096×8bit(4kbytes)
RAM	128×4bit
EEPROM	16×8bit
Clock frequency	500KHz
Clock frequency generation	CR oscillation
Package	20pin SSOP

4.2 RF block

Nominal frequency	315MHz
Frequency generation	SAW resonator
Modulation	ASK(A1D)
Bit transmission rate	1000bps or 500bps
Duty cycle	0.5
Antenna	PCB pattern type

4.3 Others

Dimension	53.5mm×30mm×12mm
Weight	20g
Battery	Lithium cell (CR2032) Manufacturer: MATSUSHITA Battery corporation etc.
Operation Voltage	DC 3V, 10mA
Operation Temperature	-20°C ~ +60°C

5. Features

5.1 Transmission frame

The transmission begins immediately in case of LOCK or UNLOCK or PANIC button is pressed. The transmission frame consists of the six data frame.

The transmission data frame consists of 63 bits length. The first 8 bits comprise the synchronous region. The second 50 bits are the vehicle identification region. The third 4 bits are for each button function. The last 1 bit make up the ending region.

16 million different identification codes are available. The security code is always changed in case of any of the buttons is pressed. The transmission time is typically 600 milliseconds.

The following figure explains the code and timing chart of each function:

LOCK	:	"1110" (E)
UNLOCK	:	"1101" (D)
TRUNK	:	"0110" (6)
PANIC	:	"1011" (B)

5.2 Battery saving

To prevent the battery exhaustion, the micro-computer of the transmitter is usually inactive. When the button will be pressed, the micro-computer wakes up immediately and judges which button is pressing. Then the micro-computer constructs the transmission frame and radiates it from the antenna. After transmitting, the micro-computer switches stand-by mode by itself.

6.2 Parts layout
