Test Location: CKC Laboratories • 22116 23rd Drive SE, Suite A • Bothell, WA 98021 • 1-800-500-4EMC (4362)
 Customer: **Itron, Inc.**
 Specification: **15.247(d) / 15.209 Radiated Spurious Emissions**
 Work Order #: **101674** Date: 8/27/2018
 Test Type: **Radiated Scan** Time: 17:12:50
 Tested By: Michael Atkinson Sequence#: 8
 Software: EMITest 5.03.11

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 3			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 3			

Test Conditions / Notes:

Frequency Range: Fundamental
 Frequency tested: Low and High Channels
 Firmware power setting: Max
 Firmware: CAM3-DEV Major Number 4, Minor Number 7, Build Number 153, Revision Number 787268
 Test Software: CAM3 FCC Test Helper v14

Modulation Types:
 10k GFSK, 50k GFSK, 150k GFSK
 6.25k OQPSK, 12.5k OQPSK
 200k OFDM, 600k OFDM, 1.2M OFDM (Hybrid)
 Hopping modes: 10k GFSK, 6.25k OQPSK, 200k OFDM, 1.2M OFDM.

Antenna type: External Colinear Omni
 Antenna Gain : 5.5dBi (remote)

Duty Cycle: Tested at 100%
 Test Location: Bothell Lab C3
 Test Method: ANSI C63.10 (2013)
 Temperature (°C): 22-24
 Relative Humidity (%): 38-42

Setup: The EUT is continuously transmitting with modulation on ISM port.
 The EUT is connected to external antenna.
 Low and High channels investigated for Band Edge.
 All modulation types investigated in addition to several modulations investigated as worst case for frequency hopping mode.

Horizontal and Vertical measurement antennas investigated, worst case reported.
 Hopping mode followed correct pseudo-random pattern, but Tx on time and time between hops were not controlled at time of test.

Frequency Range: Fundamental Frequency tested: Low and High Channels Firmware power setting: Max Firmware: CAM3-DEV Major Number 4, Minor Number 7, Build Number 153, Revision Number 787268 Test Software: CAM3 FCC Test Helper v14 Modulation Types: 10k GFSK, 50k GFSK, 150k GFSK 6.25k OQPSK, 12.5k OQPSK 200k OFDM, 600k OFDM, 1.2M OFDM (Hybrid) Hopping modes: 10k GFSK, 6.25k OQPSK, 200k OFDM, 1.2M OFDM. Antenna type: External Colinear Omni Antenna Gain : 8.15dBi with 3dB attenuator (remote) Duty Cycle: Tested at 100% Test Location: Bothell Lab C3 Test Method: ANSI C63.10 (2013) Temperature (°C): 22-24 Relative Humidity (%): 38-42 Setup: The EUT is continuously transmitting with modulation on ISM port. The EUT is connected to external antenna. Low and High channels investigated for Band Edge. All modulation types investigated in addition to several modulations investigated as worst case for frequency hopping mode. Horizontal and Vertical measurement antennas investigated, worst case reported. Hopping mode followed correct pseudo-random pattern, but Tx on time and time between hops were not controlled at time of test.

15.247(f) Hybrid Systems

15.247(f) Average Time of Occupancy

Manufacturer's Declaration

CKC Laboratories was not contracted to perform the testing due to the required equipment and firmware to exercise the EUT's multiple pseudo-random hopping sequences was not available and that the complexity of the different modulations and modes depend on the device to be in a fully operating network environment.

Therefore, the manufacturer declares the following:

With the multiple modulations, modes and hop tables, the mode with the worst-case Time of Occupancy to demonstrate 400mS compliance is 399.8mS in 10 seconds, since this modulation is > 250kHz and < 500 kHz OBW. Each session of multiple short transmissions takes place on one of 64 different channels in a pseudorandom sequence. The algorithm that determines the pseudo-random hop sequence ensures all 64 channels are used equally on the average.

Additionally, the manufacturer declares the following:

Since the 1.2Mbbs modulation is a hybrid blending both DTS and DSS, we comply with the channel occupancy requirement of 400ms in 12.4 seconds (31 channels X 400mS = 12.4 seconds).

Itron employs hopping patterns based on a pseudo-random sequence generated by an algorithm. The algorithm can have multiple components generated, that each has its own pseudo-random sequence.

The firmware insures the channels are used in the prescribed pseudo random order, therefore, it maintains equal channel usage.

The system has single channel receiver bandwidths that match the transmitter's modulation bandwidth that is enabled.

With the transmitter and receiver in synchronization within the network, transmitters switch frequencies in synchronization with the receiver.

Test Location: CKC Laboratories • 22116 23rd Drive SE, Suite A • Bothell, WA 98021 • 1-800-500-4EMC (4362)
 Customer: **Itron, Inc.**
 Specification: **15.207 AC Mains - Average**
 Work Order #: **101674** Date: 8/22/2018
 Test Type: **Conducted Emissions** Time: 08:58:55
 Tested By: Michael Atkinson Sequence#: 9
 Software: EMITest 5.03.11 115VAC 60Hz

Equipment Tested:

Device	Manufacturer	Model #	S/N
Configuration 2			

Support Equipment:

Device	Manufacturer	Model #	S/N
Configuration 2			

Test Conditions / Notes:

Frequency Range: 150kHz-30MHz
 Frequency tested: Mid Channel
 Firmware power setting: Max
 Firmware: CAM3-DEV Major Number 4, Minor Number 7, Build Number 153, Revision Number 787268
 Test Software: CAM3 FCC Test Helper v14
 Modulation: 10k GFSK

 Antenna type: External Colinear Omni
 Antenna Gain: 2.8dBi (attached), 5.5dBi (remote), 8.15dBi with 3dB attenuator (remote)

 Duty Cycle: Tested at 100%
 Test Location: Bothell Lab C3
 Test Method: ANSI C63.10 (2013)
 Temperature (°C): 22-24
 Relative Humidity (%): 38-42

 Setup: The EUT connected to AC mains through LISN.
 The EUT ISM port is continuously transmitting with modulation into external antenna.
Selected configuration used as representative and worst case.
 Also investigated low and high transmit channels, the remotely located antennas, as well as other modulation types 150k GFSK, 6.25k OQPSK, 200k OFDM, 1.2M OFDM, and hopping with modulation on 10k GFSK as well as 1.2M OFDM.

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\text{dB}\mu\text{V}/\text{m}$, the spectrum analyzer reading in $\text{dB}\mu\text{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	($\text{dB}\mu\text{V}$)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	($\text{dB}\mu\text{V}/\text{m}$)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
