1. Reference Standards

Measurements were performed according to the following procedures and standards:

- 1) ANSI C63.4: 2014
- 2) FCC Publication, "Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating under §15.247", June 5, 2014
- 3) Industry Canada RSS-Gen Issue 4
- 4) Industry Canada RSS-247 Issue 1
- 5) Industry Canada ICES-003 Issue 5

All measurements were performed in a 3-meter semi-anechoic chamber and the control room.

1.1 Test Facility

The 3-meter semi-anechoic chamber used to collect conducted and radiated emission data is located at 22 Link Drive, Rockleigh, New Jersey. This test facility has been placed on file with the FCC, Registration Number: 412871, and Industry Canada, Site Number: 5683C-1.

2. System Test Configuration

2.1 Product Description

The equipment under test (EUT) is a Digital QMT® Drap Motor for QMTDC Series, infiNET EX®, model: CSM-QMTDC-DRP-3-EX, manufactured by Crestron Electronics, Inc.

Model Number: CSM-QMTDC-DRP-3-EX

2.2 Block Diagram

2.3 EUT Setup Justification

The system was configured for testing in a representative user configuration with nominal interface data activity and typical loading.

2.4 EUT Exercise Software and Mode(s) of Operation

The EUT was configured to transmit continuously.

3.2 Antenna Requirements

The product uses a SMD mounting antenna embedded into the PCB. The gain of the antenna is 2.1dBi. Please see antenna exhibit for more details.

Trace antenna is unique in the sense of complying with FCC §15.203, §15.204(b), and §15.204(c).

3.3 6 dB bandwidth

Criterion: The minimum 6 dB bandwidth shall be at least 500 kHz.

Test Procedure: Per 558074 D01 DTS Meas Guidance v03r02 § 8.

- a) Set RBW = 100 kHz.
- b) Set the video bandwidth (VBW) $\geq 3 \times$ RBW.
- c) Detector = Peak.
- d) Trace mode = max hold.
- e) Sweep = auto couple.
- f) Allow the trace to stabilize.
- g) Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

3.3 Power Output

Criterion: The maximum peak conducted output power shall not exceed 1 Watt or 30 dBm

Test Procedure: Per 558074 D01 DTS Meas Guidance v03r02 § 9.1.1

- a) Set the RBW $\geq$ DTS bandwidth.
- b) Set VBW $\geq 3 \times$ RBW.
- c) Set span $\geq 3 \times$ RBW
- d) Sweep time = auto couple.
- e) Detector = peak.

3.4 Band Edge Conducted

Criterion: In any 100 kHz bandwidth outside the frequency band, the RF power shall be at least 20 dB below that in the 100 kHz bandwidth within the band.

Test Procedure: Per 558074 D01 DTS Meas Guidance v03r02 § 11

The DTS rules specify that in any 100 kHz bandwidth outside of the authorized frequency band, the power shall be attenuated according to the following conditions:

- a) If the maximum peak conducted output power procedure was used to demonstrate compliance as described in 9.1, then the peak output power measured in any 100 kHz bandwidth outside of the authorized frequency band shall be attenuated by at least 20 dB relative to the maximum in-band peak PSD level in 100 kHz (*i.e.*, 20 dBc).
- b) If maximum conducted (average) output power was used to demonstrate compliance as described in 9.2, then the peak power in any 100 kHz bandwidth outside of the authorized frequency band shall be attenuated by at least 30 dB relative to the maximum in-band peak PSD level in 100 kHz (*i.e.*, 30 dBc).
- c) In either case, attenuation to levels below the 15.209 general radiated emissions limits is not required.

3.6 Power Spectral Density

Criterion: The Power Spectral Density shall not be greater than 8dBm in any 3 KHz band.

Test Procedure: Per 558074 D01 DTS Meas Guidance v03r02 § 10.2

Set analyzer center frequency to DTS channel center frequency.

- b) Set the span to 1.5 times the *DTS bandwidth*.
- c) Set the RBW to: $3 \text{ kHz} \leq \text{RBW} \leq 100 \text{ kHz}$.
- d) Set the VBW $\geq 3 \times \text{RBW}$.
- e) Detector = peak.
- f) Sweep time = auto couple.
- g) Trace mode = max hold.
- h) Allow trace to fully stabilize.
- i) Use the peak marker function to determine the maximum amplitude level within the RBW.
- j) If measured value exceeds limit, reduce RBW (no less than 3 kHz) and repeat.

3.7 Radiated Spurious Emissions

Criterion: Radiated spurious emissions which fall in the restricted bands must comply with the radiated emission limits specified in FCC § 15.209(a) and Table 2 of IC RSS-Gen.

Test Procedure: Per 558074 D01 DTS Meas Guidance v03r02 § 11
Radiated spurious emission was performed from 30 MHz to the tenth harmonics of the carrier. For each scan of radiated emission measurement, the procedures for maximizing emissions were followed. The EUT was rotated and antenna height was varied between 1meter (m) and 4m in order to maximize the observed levels. Measurements in both horizontal and vertical polarities were made and the data was recorded. All radiated emission measurements, up to 18 GHz, were performed at 3m distance between an antenna and the EUT. All radiated emission measurements, above 18 GHz, were performed at 1m distance between an antenna and the EUT.

Block Diagram:

The peak level of radiated emissions above 1 GHz was measured with a resolution bandwidth (RBW) of 1 MHz and a Video Band Width (VBW) of 3 MHz. Average level was measured with VBW of 10Hz, Duty Cycle

Correction Factor (DCCF) was applied to the harmonics.

Over the 30MHz to 18GHz frequency range, the EUT was distanced 3 meters from the receive antenna (bilog or double ridge) and tested only in the orientation seen in the Figure below. The position and orientation of the integral antenna within the EUT is shown as a short line in red at the edge of the lower base of the EUT, in relation to three orthogonal directions marked “X”, “Y” and “Z” in black, as seen in the same Figure. The EUT antenna projection in the X-Z plane was oriented approximately 45 degrees from Z and X axes, where the Z axis is pointing to the receiving antenna and the Y axis is pointing to the ceiling of the test chamber.

Sample Calculation of the Electric Field Magnitude

The magnitude of the Electric field, E is calculated in $\text{dB}\mu\text{V/m}$ in terms of the measured antenna output voltage and three transducer factors as follows:

$$E (\text{dB}\mu\text{V/m}) = \text{AOV}(\text{dB}\mu\text{V}) + \text{AF}(\text{dB/m}) + \text{CL}(\text{dB}) - \text{AG}(\text{dB})$$

where,

$$\text{AOV}(\text{dB}\mu\text{V}) = \text{Antenna Output Voltage in dB}(\mu\text{V}),$$

$AF(dB/m)$ = Antenna Factor in dB(1/m),

$CL(dB)$ = Cable Loss in dB,

$AG(dB)$ = Amplifier Gain in dB

The three transducer factors ***AF***, ***CL*** and ***AG*** are stored in the EMI Receiver, as functions of frequency, over corresponding frequency ranges.

3.8 Transmitter AC Power line Conducted Emissions

Performance Criterion: AC power line conducted emissions shall not exceed the limits specified in FCC § 15.207 and Table 4 of IC RSS-Gen.

Test Details: AC power line conducted emissions were performed from 150 kHz to 30 MHz and measured with a resolution bandwidth of 9 kHz. EUT was set in the receiving mode. Refers to the following screen captures (using a peak detector) and block diagram

Block Diagram:

Note: AC side of AC-DC (support power supply) conducted emissions were measured.

Calculation of the Duty Cycle Correction Factor (DCCF)

The DCCF is defined by the following relationship:

$$DCCF(dB) = 20 \log_{10}(\{\text{sum of durations of pulses over a 100ms interval}\}/100\text{ms})$$

four different pulses repeated four times over a 100 ms interval, as follows:

puls1 duration = 1712.82 μs

puls2 duration = 472.44 μs

puls3 duration = 3910.26 μs

puls4 duration = 359.49 μs

Sum of Puls Durations = 6455.00 μs

4x Sum of Puls Durations = 25820.00 μs

Hence,

$$DCCF = 20 \log_{10}(4x \text{ Sum of Puls Durations}/100000 \text{ μs}) = -11.76 \text{ dB}$$
