Section 1. Summary of Test Results

General

All measurements are traceable to national standards.

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, Subpart C. Radiated tests were conducted in accordance with ANSI C63.4-2001. Radiated emissions are made on an open area test site. A description of the test facility is on file with the FCC.

THIS TEST REPORT RELATES ONLY TO THE ITEM(S) TESTED.

THE FOLLOWING DEVIATIONS FROM, ADDITIONS TO, OR EXCLUSIONS FROM THE
TEST SPECIFICATIONS HAVE BEEN MADE.

Section 2. General Equipment Specification

Manufacturer: Vtech (Dongguan) Electronics and Communications Ltd.

Model No.: MI6823 & MI6863 CI

Serial No.: None

Date Received In Laboratory: November 16, 2004

Nemko Identification No.: Refer to Nemko Receiving Report.

Operating Frequency: HS TX 2401.056 -> 2482.272 MHz

Peak Output Power (ERP): 18.8dBm (0.076W)

Emission Designator 620KF1D

Rated Power: HS 20.0dBm (Typical)

Modulation: GFSK

Antenna Data: The EUT uses a 0dBi integral antenna.

Section 3. 20 dB Bandwidth

Para. No.: 15.247(a) (1)(ii)

Test Performed By: Chris Maidens	Date of Test: Nov. 17, 2004
----------------------------------	-----------------------------

Limits: 1MHz

Measurement Data: See Plot

Section 4. Occupancy Time

Para. No.: 15.247(a) (1) (iii)

Test Performed By: Chris Maidens	Date of Test: Nov. 17, 2004
---	------------------------------------

Limit: For the purposes of this section, hybrid systems are those that employ a combination of both frequency hopping and digital modulation techniques. The frequency hopping operation of the hybrid system, with the direct sequence or digital modulation operation turned off, shall have an average time of occupancy on any frequency not to exceed 0.4 seconds within a time period in seconds equal to the number of hopping frequencies employed multiplied by 0.4. The digital modulation operation of the hybrid system, with the frequency hopping operation turned off, shall comply with the power density requirements of paragraph (d) of this section.

Measurement Data: See Plots

EQUIPMENT: Vtech MI5823 & MI6863 Cordless Phone Handset

Handset:

(17 hopping frequencies) x 0.4= 6.8 seconds

Section 5. Number of Hopping Channels

Para. No.: 15.247(a)(1)(ii)

Test Performed By: Chris Maidens	Date of Test: Nov. 14, 2004
---	------------------------------------

Limit: Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

Measurement Data: The EUT uses 17 channels (See Plots)

Section 6. Minimum Channel Separation

Para. No.: 15.247(a)(1)

Test Performed By: Chris Maidens	Date of Test: Nov. 17, 2004
---	------------------------------------

Limit: Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

Measurement Data: Channel Separation was measured to be 876kHz, which is >630kHz (the 20dB BW of this device)

See Plot on next page.

Section 7. Peak Output Power

Para. No.: 15.247 (b)(1)

Test Performed By: Chris Maidens	Date of Test: Nov. 18, 2004
----------------------------------	-----------------------------

Limit: 0.125W (21dBm)

Measurement Data: The highest power was 18.8dBm on Channel 47 of the EUT. See conducted plots.

All measurements were performed using fresh charged batteries.

Maximum radiated power = 18.8dBm +0dBi = 18.8dBmEIRP
Maximum allowable radiated power is 36dBmEIRP,
30dBm + 6dBi

Section 8. Spurious Emissions

Para. No.: 15.247(d)

Test Performed By: Chris Maidens	Date of Test: Dec. 7, 2004
----------------------------------	----------------------------

Limit: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Measurement Data: The spectrum was searched using a sample modified for conducted measurements. Emissions related to the fundamental, which fall within restricted bands, were measured using an unmodified sample for radiated measurements.

Measurements were performed on three orthogonal axis, with freshly charged batteries.

The spectrum was searched from 30MHz to 25GHz.
