Maximum Permissible Exposure (MPE) (for reference)**

2.1091. Radiofrequency radiation exposure evaluation: mobile devices. (a) Requirements of this section are a consequence of Commission responsibilities under the National Environmental Policy Act to evaluate the environmental significance of its actions. See subpart I of part 1 of this chapter, in particular § 1.1307(b). (b) For purposes of this section, a mobile device is defined as a transmitting device designed to be used in other than fixed locations and to generally be used in such a way that a separation distance of at least 20 centimeters is normally maintained between the transmitter's radiating structure(s) and the body of the user or nearby persons.

1.1307 (b) In addition to the actions listed in paragraph (a) of this section, Commission actions granting construction permits, licenses to transmit or renewals thereof, equipment authorizations or modifications in existing facilities, require the preparation of an Environmental Assessment (EA) if the particular facility, operation or transmitter would cause human exposure to levels of radiofrequency radiation in excess of the limits in §§1.1310 and 2.1093 of this chapter.

1.1310. Radiofrequency radiation exposure limits. - (e) Table 1 below sets forth limits for Maximum Permissible Exposure (MPE) to radiofrequency electromagnetic fields. (The criteria listed in Table 1 shall be used to evaluate the environmental impact of human exposure to radiofrequency (RF) radiation as specified in §1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of §2.1093 of this chapter.)

2.1093. Radiofrequency radiation exposure evaluation: portable devices.

Determine the maximum power density for the general / uncontrolled population minimum separation distance of 20 cm. The power density is calculated as:

P_d = power density in mW/cm^2

P_t = transmit power in milliwatts

$$P_d = \frac{P_t \times G}{4 \times \pi \times r^2}$$

G = numeric antenna gain

r = distance between body and transmitter in centimeters.

FCC Limits: 902.2MHz / 1500 = 0.601 mW / cm^2 @ 20cm

IC Limits: 902.2MHz / 150 = 6.01 W / M^2 (@ 0.2M)

← issue4

$f=902.2$; $0.02619 \times f^{0.6834} w/m^2 = 2.74 W / M^2$ (@ 0.2M)

← issue5

ISED max limit for calculation: $1.31 \times 10^{-2} f^{0.6834} \text{ watts eirp} = 1.37 \text{ watts EIRP}$

(1) EIRP (dBm) used 412172 D01 Determining ERP and EIRP v01r01 to calculate EIRP

(2) Antenna gain (dBi) = EIRP (dBm) - Conducted power (dBm)

(3) $P_d = (mW \times \text{ant. gain numeric}) / (4 \times \pi \times 20cm^2) = mW / cm^2 @ 20 cm$

(4) $W/m^2 @ 0.2M = 10 \times mW/cm^2 @ 20 cm$

(5) $dBm = 10 \log_{10}(mW)$
