2. EUT DESCRIPTION

The Bluetooth Protocol Analyzer is a Frequency Hopping Spread Spectrum Wireless Transceiver that operates on the 2400 – 2483.5 MHz band. Using the Bluetooth Protocol Analyzer you can connect to and monitor the activity of a Bluetooth piconet and log data containing all of the baseband packets transmitted between the participating Bluetooth devices. There are two antennas in the unit, for both transmit and receive diversity. One is a PCB antenna with 2.52 dBi gain and the other is a Patch antenna with 2.17 dBi gain.

TEST PROCEDURE

The transmitter output was connected to the spectrum analyzer through an attenuator; the lower and upper band edge of the EUT is investigated.
The resolutions and video bandwidth were set to 100kHz.

Fig 1: Radiated Emission Measurement 30 to 1000 MHz

Fig 2: Radiated Emission Above 1000 MHz

TEST PROCEDURE

1. The EUT was placed on the turntable 0.8 meter above ground in 3 meter open area test site.
2. Set the resolution bandwidth to 100KHz in the test receiver and select Peak function to scan the frequency below 1 GHz.
3. Shift the interference-receiving antenna located in antenna tower upwards and downwards between 1 and 4 meters above ground and find out the local peak emission on frequency domain.
4. Locate the interference-receiving antenna at the position where the local peak reach the maximum emission.
5. Rotate the turntable and stop at the angle where the measurement device has maximum reading.
6. Shift the interference-receiving antenna again to detect the maximum emission of the local peak.
7. If the reading of the local peak under Peak function is lower than limit by 6dB, then Quasi Peak detection is not needed and this reading should be recorded. And if it is higher than Peak limit, then the test is fail. Others, switch the receiver to Quasi Peak

function, set the resolution bandwidth to 100kHz and repeat the procedures (3)~(6). If the reading is lower than limit, this reading should be recorded, otherwise, the test is fail.

8. Set the resolution and video bandwidth of the spectrum analyzer to 1MHz and repeat procedures (3)~(6) for frequency band from 1 GHz to 10 times carrier frequency.

9. If the reading for the local peak is lower than the Average limit, no further testing is needed in this local peak and this reading should be recorded. If it is higher than Average limit but lower than Peak limit, then set the resolution bandwidth to 1MHz and video bandwidth to 10Hz. Repeat procedures (3)~(6). If the maximum reading is lower than Average limit, then this reading should be recorded. If it is higher, then the test is fail.

The plot shows the Power Spectral Density (PSD) of a signal across a frequency range from 0.45 MHz to 30 MHz. The y-axis represents the signal level in dBμV, ranging from -10 to 70. A red horizontal line at approximately 45 dBμV indicates the FCC Class B limit. The signal (black line) is mostly below this limit, with some peaks around 5-10 MHz. A green line shows a smoothed version of the signal.
