

Reason for Request for Permissive Change 2

The only change in the EUT from the original FCC submittal is in the antenna. The old antennas connected directly to the back of the EUT and had a +2.5 dBi gain. The antenna for the permissive change is mounted away (remote) from the EUT but is connected to the EUT via white coaxial cables. The new permissive change antenna is a directional antenna, vertically polarized with +5.0 dBi gain.

A new test report incorporating the data and photos with both the old antenna and the new antenna has been uploaded.
